

2019 CARIS Phase 1 Report

Jason Frasier Manager, Economic Planning

Management Committee

July 1, 2020

Agenda

- CARIS Process Overview
- 2019 CARIS Phase 1 Base Case
 - Development, Results, & Key Findings

"70x30" Scenario

• Development, Results, & Key Findings

Next Steps

CARIS Process Overview

NYISO Comprehensive System Planning Process

CARIS Phase 1 Process

CARIS Phase 1 Objectives

Identify and report congestion

- 5-year "historic" congestion
- 10-year "projected" congestion
- Provide information to stakeholders, developers & other interested parties
 - Select top congested transmission elements
 - Project benefits of relieving the most congested elements or groupings using generic solutions
 - Identify factors that produce or increase congestion

CARIS Phase 2 Objectives

- Evaluate specific projects
- Production costs savings must exceed project costs over first ten years of operation
 - Sum of LBMP savings (for zones with savings) over first ten years of operation must exceed project costs
 - Cost allocation and cost recovery through the NYISO tariff for qualified transmission projects that receive 80% vote of the identified beneficiaries
- Perform additional CARIS studies for all interested parties and for all solution types

2019 CARIS Phase 1 Base Case

Base Case Development

- All assumptions developed pursuant to CARIS procedures and in collaboration with stakeholders at ESPWG
- 10-Year Study Period (2019-2028)
- Based on 2019-2028 Comprehensive Reliability Plan (CRP)
- 2019 Gold Book Load and Capacity Forecasts
- Resource changes pursuant to base case inclusion screening rules
- Assumption lockdown date of August 1, 2019

Base Case Key Assumptions

- Fuel & Emission Price Forecasts as of 8/1/2019
- 2019-2028 CRP transmission model with actual operating limits
- Transmission upgrades
 - Empire State Line Project / Western New York Public Policy project (2022)
 - NYPA rebuild of Moses-Adirondack 230 kV circuits (2023)
 - AC Transmission Public Policy projects Segments A and B (2024)
 - Expanding monitoring and securing of lower voltage system consistent with NYISO operations

Resource Assumptions

- Cricket Valley Energy center modeled in-service (2020)
- Indian Point 2 and 3 are retired (2020/2021)
- Other generation projects that met inclusion rules

Selection of Studies

- Rank and group elements based on five-year historic and 10-year projected Demand\$ Congestion
 - Historic Demand\$ Congestion data drawn from NYISO's posted congestion reports
 - Forecasted Demand\$ Congestion estimated using General Electric's Multi-Area Production Simulation (MAPS) software
- Select three study areas based on potential ten-year projected production cost savings

Historic and Projected Demand\$ Congestion (\$M)

2019 CARIS Study Groupings

Project Benefits

- Implement transmission, generation, demand response and energy efficiency generic solutions for all six studies
 - Feasibility of each solution is not evaluated
- Estimate the potential benefits associated with relieving congestion for each solution type using GE-MAPS production cost simulation software
- Per the NYISO's Tariff, benefits are limited to NYCA-wide production cost savings for the purpose of assessing project economics

Generic Solutions

Generic Solutions						
Studies	Central East (Study 1)	Central East-Knickerbocker (Study 2)	Volney-Scriba (Study 3)			
TRANSMISSION						
Transmission Path	Edic-New Scotland	Edic-New Scotland-Knickerbocker	Volney-Scriba			
Voltage	345 kV	345 kV	345 kV			
Miles	85	100	10

Blocks	340 MW	340 MW	340 MW			
	DEM	IAND RESPONSE				
	Zone F : 100 MW	Zone F : 100 MW	Zone F : 100 MW			
Blocks	Zone G : 100 MW	Zone G : 100 MW	Zone G : 100 MW			
	Zone J : 200 MW	Zone J : 200 MW				
ENERGY EFFICIENCY						
	Zone F : 100 MW	Zone F : 100 MW	Zone F : 100 MW			
Blocks	Zone G : 100 MW	Zone G : 100 MW	Zone G : 100 MW			
	Zone J : 200 MW	Zone J : 200 MW				

Generic Solution Cost Estimates

- Low, mid, and high estimates for each solution type
- Cost Estimate Sources
 - **Transmission:** NYSDPS's AC Transmission proceeding and other third-party sources
 - Generation: 2016 NYISO Demand Curve Reset study for combined cycle unit
 - Energy Efficiency: PSC Comprehensive Energy Efficiency Initiative (Case 18-M-0084)
 - **Demand Response:** PSC Proceeding on Motion of the Commission to Develop Dynamic Load Management Programs (Case 14-E-0423)

Ten-Year Production Cost Savings for CARIS Studies (\$2019M)

	Ten-Year Production Cost Savings (\$2019M)						
Study	Transmission Solution	Generation Solution	Demand Response Solution	Energy Efficiency Solution			
Study 1: Central East	115	103	17	1,061			
Study 2: Central East-Knickerbocker	117	110	17	1,061			
Study 3: Volney-Scriba	22	137	9	530			

Benefit/Cost Analysis

- Benefit/Cost ratios are reported for each solution, based upon ten years of projected NYCA-wide Production Cost Savings (CARIS primary metric) compared to the estimated ten years of project costs
 - 7.08% Discount Rate
 - 16% Capital Recovery Factor

Generic Solution Benefit/Cost Results

Study 3: Volney-Scriba	0.41	0.31	0.25	0.55	0.41	0.33	

- Additional benefit metrics report the change between the generic solution-case value and the base case value over the ten-year study period
 - For 2019 CARIS Phase 1, these include changes to generator payments, load payments, TCC payments, electric loss costs, ICAP costs and emissions
 - For information only

2019 CARIS 1 Scenarios

Scenario	Description
High Load Forecast	Higher penetration of electric vehicles and electric heat pumps
Low Load Forecast	Higher energy efficiency levels achieved
Higher Natural Gas Prices	Derived from 2019 EIA Annual Energy Outlook High Forecast
Lower Natural Gas Prices	Derived from 2019 EIA Annual Energy Outlook Low Forecast

Key Findings: Base Case

- Generic solutions offered a measure of congestion relief and production cost savings
- Transmission projects studied did not result in Benefit/Cost ratios in excess of 1.0, based on generic cost estimates and production cost savings only
- With the inclusion of the AC Transmission Public Policy Projects starting in year 2024, congestion levels decreased substantially compared with prior study years
- Central East is still, however, the most congested transmission corridor over the ten-year study period (2019-2028) because of high congestion during the five-year period preceding the AC Transmission projects (2019-2023)

2019 CARIS Phase 1 "70x30" Scenario

70x30 Scenario Description

- The Climate Leadership and Community Protection Act (CLCPA) mandates that 70% of New York's end-use energy consumption be served by renewable energy by 2030 ("70x30")
 - Distributed solar goal of 6,000 MW by 2025
 - Energy storage goal of 3,000 MW by 2030
 - Offshore wind goal of 9,000 MW by 2035

 The 70x30 Scenario is not intended as a roadmap for compliance with the mandates of the CLCPA, but does provide insights into renewable generation pockets that are likely to form due to limited transmission capability in the areas where wind and solar resources are likely to be constructed

70x30 Scenario Description

- The 70x30 Scenario models these targets through 2030 for two potential load forecasts and identifies system constraints, renewable generation curtailments, and other potential operational limitations
- Renewable capacity build-out assumptions were developed in collaboration with stakeholders utilizing the NYISO interconnection queue as a reference point

70x30 Scenario Key Assumptions

- All coal plants retired by 2021
- "Peaker" rule replacements corresponding to local Compensatory MW additions identified in 2019-2028 CRP
- Renewable resource modeling
 - Includes hydro, utility-scale solar, behind-the-meter solar, land-based wind, and offshore wind total capacity
 - Additional HQ import into NYC via HVDC
- Approximately 1,000 new transmission contingencies were added as identified in the MAPS/TARA contingency screening process

Constrained Pockets

- Renewable generation pockets are likely to develop throughout the state as the existing transmission grid would be overwhelmed by the significant renewable capacity additions
- In each of the five major pockets observed, renewable generation is curtailed due to the lack of sufficient bulk and local transmission capability to deliver the power
 - 11% of annual renewable energy production curtailed
- Additional transmission expansion, at both bulk and local levels, will be necessary to efficiently deliver renewable power to New York consumers

- Western New York (Pocket W)
 - Mainly 115 kV in Buffalo and Rochester
 - Up to 18% Solar Curtailment
- North Country (Pocket X)
 - 115 kV & 230 kV in Northern NY
 - Up to 63% Wind Curtailment

• Capital Region (Pocket Y)

- Mainly 115 kV in the Capital Region
- Up to 54% Solar Curtailment

Southern Tier (Pocket Z)

- Mainly 115 kV in the Finger Lakes
- Up to 37% Wind Curtailment

Offshore Wind

- New York City and Long Island
- Up to 9% OSW Curtailment

Load Impacts

- Two scenarios with varying energy forecasts and associated renewable build-outs were simulated
- The level of renewable generation investment necessary to achieve 70% renewable end-use energy by 2030 could vary greatly as energy efficiency and electrification adoption unfolds
 - Base Load **37,600 MW** of renewable resources
 - Scenario Load **31,000 MW** of renewable resources
- In both scenarios significant transmission constraints exist when adding the necessary volume of renewable generation to achieve the 70% target

Fossil Fleet Impacts

- The large amount of renewable energy additions to achieve the CLCPA goals would change the operations of the fossil fuel fleet
 - Decrease in annual energy output of the fossil fleet
 - Flexible generators are dispatched more often while inflexible units are dispatched less or not at all
- Sensitivity analysis indicates that if the statewide nuclear generation fleet retired, emissions from the fossil fuel fleet would likely increase; the degree of that impact is dependent on the timing of nuclear retirements and the pace of renewable resource additions

Energy Storage

- Sensitivity analysis performed including energy storage resources
- Results indicate that energy storage could decrease congestion, and when dispatched effectively, would help to increase the utilization of the renewable generation, particularly the solar generation tested
- The targeted analysis showed that energy storage likely cannot by itself completely resolve the transmission limitations in the pockets analyzed

Next Steps

Stakeholder Engagement

2019 CARIS Phase 1 Kick-Off

- June 25, 2019 ESPWG Meeting
- Base Case
 - September-November 2019 ESPWG/TPAS Meetings

70x30 Scenario

- September 2019-June 2020 ESPWG/TPAS Meetings
- Recommendation of Approval
 - June 24th BIC Meeting

Requesting MC Recommendation of Board Approval

Next Steps

- Seek Board of Directors Approval at July Meeting
- Post Board-Approved Report on NYISO Website
- Conduct Public Information Session
- If Requested by a Market Participant, Proceed with CARIS Phase 2 Consistent with Tariff and Procedures

Our mission, in collaboration with our stakeholders, is to serve the public interest and provide benefit to consumers by:

- Maintaining and enhancing regional reliability
- Operating open, fair and competitive wholesale electricity markets
- Planning the power system for the future
- Providing factual information to policymakers, stakeholders and investors in the power system
