Invalid contingency  
 New Scotland will have breaker and a half configuration  
 Also NGRID plans to add 4th tx. bank to overcome this limitation

## 1. INTRODUCTION

This report describes the calculation of transfer limits for key interfaces in the New York State Transmission System for the Horizon Year with the Base Transmission Plan (BTP) Trial #10 projects (see Section 2 for details). The purpose of these calculations is to establish transfer limits for use in subsequent LOLE analysis.

Emergency thermal transfer limits were calculated for the following interfaces within the NYCA: Dysinger East, West Central, Volney East, Moses South, Total East, Central East, Central East + Fraser-Gilboa, Central East Group, F to G, UPNY-SENY, UPNY-ConEd, Millwood South Closed, I to J, Dunwoodie South Open, I to K and LIPA Import.

In addition, emergency voltage transfer limits were calculated for the Central East, Central East + Fraser-Gilboa and CE Group interfaces. These interfaces have traditionally been voltage limited, whereas the other interfaces have tended to be thermally limited. So for purposes of this study, voltage transfer limits were only calculated for the Central East related interfaces.

## 2. DESCRIPTION OF POWER FLOW MODEL

A power flow model representative of Horizon Year summer peak load conditions was used in this analysis. The model was developed from the BTP case described in reference [1].

The case includes the following Trial 10 facilities:

1. Oakdale-Fraser 345kV line #2
2. New Scotland-Leeds 345kV #3
3. Leeds-Pleasant Valley 345kV line #3
4. Rock Tavern-Ramapo 345kV line #2
5. National Grid 115kV transmission upgrades

**Table 2-1: Load Levels in Horizon Year Summer Peak Case**

Zone #	Zone Name	Load (MW)	Losses (MW)	Demand (MW)
1	West	2991	131	3123
2	Genessee	2267	98	2365
3	Central	3168	155	3323

### 3. CALCULATION OF EMERGENCY THERMAL TRANSFER LIMITS

Transfer limit analysis was performed to establish “short-term” emergency thermal transfer limits for thermally-constrained interfaces. The analysis was performed on the Horizon Year Trial 10 power flow case described in Section 2 of this report.

#### 3.1 Methodology

Emergency transfer limits were established using the Linear FCITC Calculation tool in the PSS<sup>TM</sup>MUST Program (version 10.2).

The emergency transfer limit is the transfer level at which:

- a branch is loaded at its normal rating (Rate A) for pre-contingency conditions, or
- a branch is loaded at its short-term emergency rating (Rate C) following a contingency

For the purposes of this analysis, transmission facilities rated 100 kV and above within NYCA (and tie-lines out of NYCA) were monitored. Engineering judgment was used to identify limiting transmission facilities. Generally, “direct tie” facilities or facilities in the vicinity of the interface being studied that became loaded at their Rate A or Rate C ratings as described above were flagged.

Interface definitions are shown in Appendix A.

The following types of contingencies were simulated based on the contingency files provided by NYISO. In addition to these contingencies, other contingencies provided by National Grid associated with wind generation in the North Country were simulated.

1. Outage of branches connected between buses with a base voltage of 100 kV and above (these included outages based on “automatic” N-1 contingency specification<sup>1</sup> in MUST and specific pre-defined branch outages)
2. Generator outages
3. Series element contingencies
4. Bus contingencies
5. HVdc contingencies

---

<sup>1</sup> Automatic N-1 contingencies were not simulated in the Con Edison system.

Phase angle regulators maintain their scheduled power flow pre-contingency but are fixed at their corresponding pre-contingency angle post-contingency.

### 3.2 Results

Table 3-1 summarizes the emergency thermal transfer limits obtained from the MUST analysis (full MUST output for the various interfaces is provided in Appendix B). Limits are rounded down to the nearest 25 MW.

Limits for the upstate interfaces were calculated without making any adjustments to the base case. Limits for the downstate interfaces are sensitive to phase angle regulator settings in Con Edison and LIPA and were calculated as described below:

Interface limits for the UPNY-SENY, UPNY-ConEd Open, Millwood South Closed, Dunwoodie South Open and I-to-J interfaces were calculated based on the following assumptions (same assumptions as in reference [1]):

- Sherman Creek PAR1 and PAR2 are scheduled at 200 MW each into NYC.
- Parkchester PAR1 and PAR2 are scheduled at 245 MW each into NYC.
- Dunwoodie North PAR1 and PAR2 are scheduled at 115 MW each into NYC.
- Dunwoodie South PAR1 and PAR2 are scheduled at 120 and 115 MW respectively into NYC.

Limits for the “I to K” and “Long Island Import” interfaces were computed by making the following adjustments:

- Neptune HVDC is scheduled at 600 MW into LIPA.
- Cross Sound Cable is scheduled at 330 MW into LIPA.
- Northport PARs are scheduled at 450 MW into LIPA.
- Jamaica – Lake Success PAR is adjusted at 85 MW into LIPA.
- Jamaica – Valley Stream PAR is adjusted at 90 MW into LIPA.
- EGC PAR1 and PAR2 are scheduled at 318 MW each into LIPA.
- Resulting base case flow on Y50 (Dunwoodie – Shore Road 345 kV) is 640 MW.

Table 3-2 compares the transfer limits from the Trial 10 case against the corresponding limits from the BTP case (see reference [1]). In general, the following observations are made from Table 3-2.

1. The limits for the Volney East interface exhibited a 10% decrease going from the BTP case to the Trial 10 case (425 MW decrease). This can be explained as follows. Compared with the Trial 10 case, more power can be transferred across the Volney East interface in the BTP case before the limiting facility (Fraser - Coopers Corners 345 kV) becomes overloaded.

This is because the Marcy - Princetown - New Scotland 345 kV line in the BTP case provides a lower impedance path out of New Scotland than the existing Porter - Rotterdam 230 kV lines in the Trial 10 case.

2. The Moses South interface exhibited a decrease of 45% in the emergency thermal transfer limits. This is because the Moses-Marcy 345 kV lines in the BTP case are substituted with the existing Moses-Porter 230 kV lines in the Trial 10 case. It should be noted that the facility that determines the emergency transfer limit for this interface is: Marcy 765/345 AT1 for loss of AT2<sup>2</sup>. This is a valid limitation considering that the post-contingency loading on AT1 is 1756 MVA (which is less than the 1866 MVA required to trigger SPS action<sup>3</sup>).
3. The Central East interface exhibited a 15% decrease in the emergency thermal transfer limits. This is because the Marcy - Princetown - N. Scotland 345 kV line (BTP case) is substituted with the existing Porter-Rotterdam 230 kV lines (Trial 10 case).
4. The Central East+Fraser-Gilboa and CE Group interfaces exhibited a 400 MW decrease in emergency transfer limits for the same reasons as in item (1) above. The limiting facility is Fraser - Coopers Corners 345 kV.
5. Emergency transfer limits for the UPNY-ConEd Open and Millwood South Closed interfaces are similar between the two cases despite the fact that the Trial 10 case does not have the Pleasant Valley - Sprainbrook HVdc (900 MW) and Pleasant Valley - Ruland Road HVdc (600 MW) transmission facilities. This is because the base case flows on AC lines comprising the UPNY-ConEd and Millwood South interfaces are generally higher in the Trial 10 case than in the BTP case (flows that were previously on the HVdc are imposed on the AC network). Therefore, the emergency transfer limits are generally similar between the two cases.
6. The emergency transfer limit for the I-to-K interface is identical to the corresponding limit derived previously<sup>4</sup>.

---

<sup>2</sup> For the purposes of this calculation, the ratings of the Marcy 765/345 kV transformers were updated as follows based on feedback received from NYPA.

Old ratings: AT1 (Normal/LTE/STE) : 1488 / 1654 / 1654 MVA; AT2: 1488 / 1793 / 2338 MVA  
New ratings: AT1 (Normal/LTE/STE): 1488 / 1650 / 1756 MVA; AT2: 1488 / 1650 / 1971 MVA

<sup>3</sup> Following the loss of Marcy AT2, the SPS trips Marcy AT1 provided the loading on each phase of AT1 exceeds 1409A at 765kV ( 1866MVA). The SPS also cross-trips the Chateauguay – Massena and Massena – Marcy 765 kV lines.

<sup>4</sup> The limiting transfer for the I-to-K and LIPA Import interfaces is Y50 (Dunwoodie – Shore Road 345 kV). The limit is based on the MW rating for Y50 (653 MW).

7. The LIPA Import interface showed a 575 MW reduction in the Trial 10 case compared to the BTP case. This is because the Trial 10 case does not have the Pleasant Valley – Ruland Road HVdc line where as the BTP case does.

**Table 3-1: Emergency Thermal Transfer Limits for Horizon Year with Trial #10 Projects**

Notes:

1. Excludes Plattsburgh-Sandbar 115 kV line.
2. Excludes Jefferson-Ramapo 500 kV line.
3. Includes Hudson Transmission Project (HTP).
4. The limiting facility for the I-to-K and LIPA Import interfaces is Y50 (Dunwoodie – Shore Road 345 kV). The limit is based on the MW rating for Y50 (653 MW).

## 4. CALCULATION OF EMERGENCY VOLTAGE TRANSFER LIMITS

Emergency voltage transfer limits were calculated on the Horizon Year power flow case described in Section 2 of this report.

### 4.1 Methodology

Emergency voltage transfer limits were calculated using the PV Analysis tool of PSS/E™ (version 30).

The limits were calculated by preparing a series of power flow cases with increasing MW transfers across the interfaces being studied and subjecting them to severe (voltage-wise) contingencies. The monitored buses were then reviewed for violations of post-contingency minimum voltage criteria and/or voltage collapse.

The testing followed NYISO practices and procedures discussed in Attachment E of the NYISO Transmission Expansion and Interconnection Manual [5]. MW transfers were increased until the point of voltage collapse was reached. In power flow analysis, this point is the highest transfer level for which a solution can be achieved. There is no solution beyond this transfer level because there are no more dispatchable reactive power resources available to support the transfer. Upon plotting the specific bus voltage (y-axis) against the pre-contingency MW transfer level (x-axis), the impending voltage collapse can be identified as the knee point on the PV curve. Based on the maximum sustainable pre-contingency MW transfer (i.e. the transfer level for which a solution can be achieved post contingency; with any further increases in power transfer rendering the system un-solvable due to reactive power deficiency), a reduced pre-contingency transfer level based on a 5% safety margin is determined. This reduced transfer is then compared against the pre-contingency MW transfer level which corresponds to a post-contingency minimum voltage at the monitored buses. In order to ensure that a voltage-based transfer limit is computed with a margin of safety, the lower of the two power transfers (i.e. 95% of that corresponding to voltage collapse point or that obtained by applying the relevant post-contingency low voltage limit) is chosen as the voltage-limited interface maximum transfer level.

The following assumptions were made for the analysis:

1. Phase angle regulators (“PARs”), switched shunts and LTC transformers are modeled as regulating pre-contingency and non-regulating post-contingency.
2. SVC and FACTS devices are set to near zero pre-contingency and allowed to operate full range post-contingency.

## 4.2 Results

Table 4-1 summarizes the emergency voltage transfer limits for the Central East, Central East + Fraser-Gilboa and CE Group interfaces (see column highlighted in yellow). For comparison purposes, corresponding limits derived earlier with the BTP projects (reference [1]) are also summarized. Limits are rounded down to the nearest 25 MW. The last two columns summarize the differences between the two sets of limits both in MW and as a percentage of the BTP limits. The Plattsburgh-Sandbar 115 kV line is not included in the interface definitions.

Figure 4-1 shows the PV curves for the Central East interface at the New Scotland 99 bus for various post-contingency conditions. For each contingency, the post-contingency voltage at New Scotland 99 bus is plotted against the pre-contingency MW flow on the interface. The most limiting contingency is tower contingency TWR 34/42 (CE18). Note from the Figure 4-1 that for this particular contingency, the nose of the curve is approx. 2950 MW. The pre-contingency transfer that corresponds to 95% of 2950 MW is 2800 MW. The post-contingency voltage at the 2800 MW transfer level is above the post-contingency low voltage limit (328 MW). Based on the above, the emergency voltage transfer limit for the Central East interface is 2800 MW.

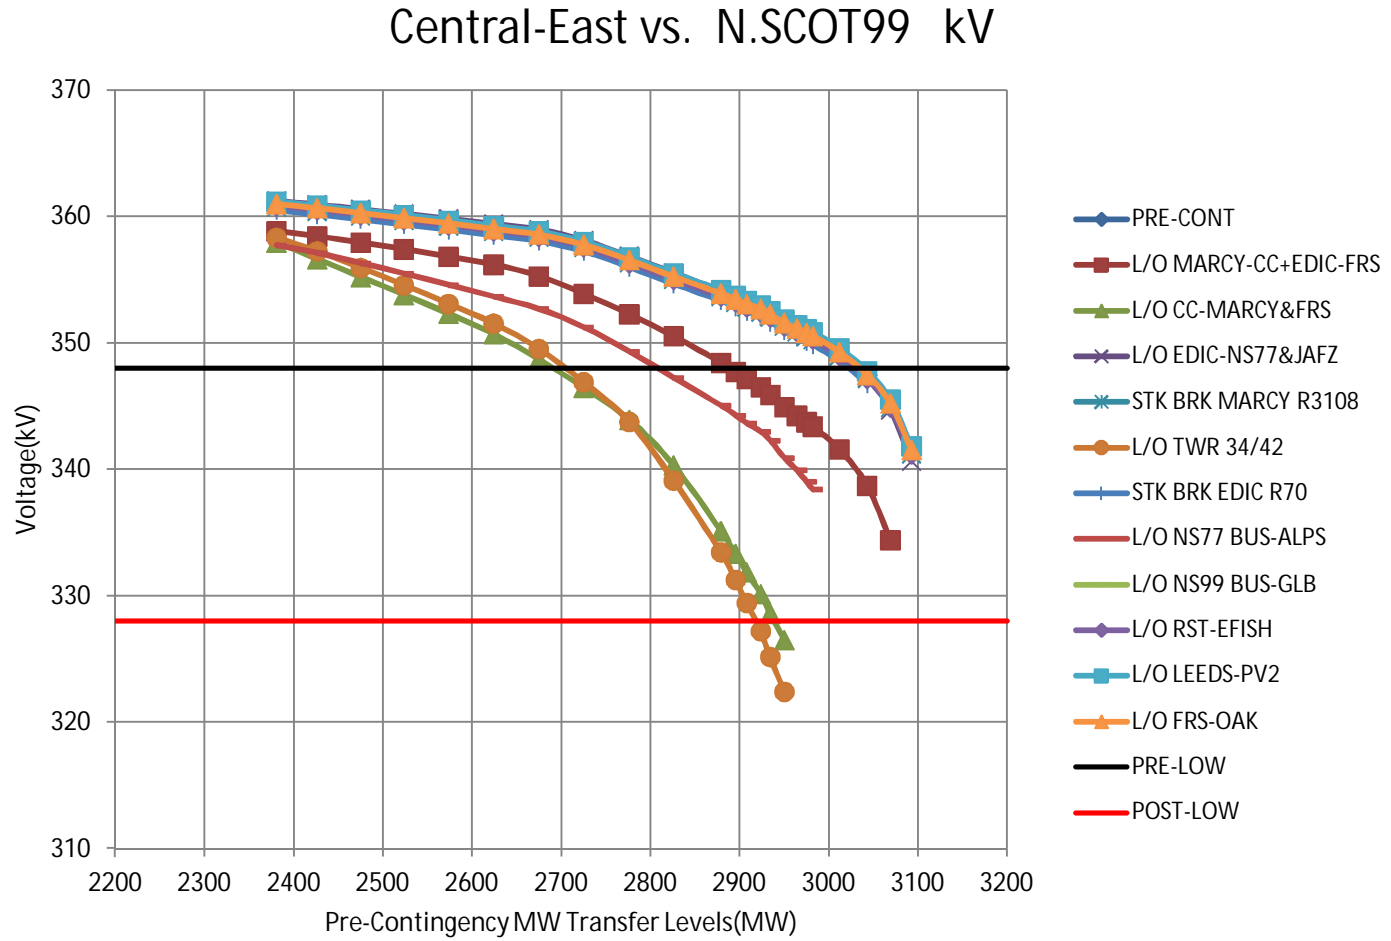

**Table 4-1: Emergency Voltage Transfer Limits**

Interfaces	Post-Contingency Low (A)		95% Voltage Collapse (B)			Pre-Contingency Low (C)		Horizon Year Limit with Trial 10 Min(A,B,C)	Horizon Year Limit with BTP		Diff with BTP Limits

## 5. CONSOLIDATION OF EMERGENCY THERMAL AND VOLTAGE TRANSFER LIMITS FOR CENTRAL EAST INTERFACE

Emergency thermal and emergency voltage transfer limits for the Central East, Central East + Fraser Gilboa and CE Group interfaces are consolidated and presented in Table 5-1. The more limiting of the two transfer limits is shown in the last column.

**Table 5-1: Consolidation of Central East Limits**

Interface	STARS Horizon Year Summer Peak Trial 10			
	Emergency Thermal Transfer Limit (MW)	Emergency Voltage Transfer Limit (MW)	Min (Thermal, Voltage)	
Central East	3550	2800	<b>2800</b>	(V)
Central East + Fraser-Gilboa	3325	3225	<b>3225</b>	(V)
CE Group	5250	5000	<b>5000</b>	(V)

(T) = Thermally-constrained

(V) = Voltage-constrained

Contin.File STARS-TTL.CON

Exclud.File ICAP.exc

Study transfer level - 3000.0 MW. Total violations: 3929

First violation - 741.5 MW.

Study transfer. From ON\_C\_EXP To GHI\_IMPORT . Transfer level - 3000.0 MW

Violations report ordered by transfer capability. Total 3929 violations

## 1. INTRODUCTION

This report describes the calculation of transfer limits for key interfaces in the New York State Transmission System for the Horizon Year with the Base Transmission Plan (BTP) Trial #9 projects (see Section 2 for details). The purpose of these calculations is to establish transfer limits for use in subsequent LOLE analysis.

Emergency thermal transfer limits were calculated for the following interfaces within the NYCA: Dysinger East, West Central, Volney East, Moses South, Total East, Central East, Central East + Fraser-Gilboa, Central East Group, F to G, UPNY-SENY, UPNY-ConEd, Millwood South Closed, I to J, Dunwoodie South Open, I to K and LIPA Import.

In addition, emergency voltage transfer limits were calculated for the Central East, Central East + Fraser-Gilboa and CE Group interfaces. These interfaces have traditionally been voltage limited, whereas the other interfaces have tended to be thermally limited. So for purposes of this study, voltage transfer limits were only calculated for the Central East related interfaces.

## 2. DESCRIPTION OF POWER FLOW MODEL

A power flow model representative of Horizon Year summer peak load conditions was used in this analysis. The model was developed from the BTP case described in reference [1].

The model includes the following Trial 9 transmission projects. All other BTP projects (see reference [1]) were removed from the model.

1. Leeds-Pleasant Valley 345kV line #3
2. National Grid 115kV transmission upgrades

**Table 2-1: Load Levels in Horizon Year Summer Peak Case**

Zone #	Zone Name	Load (MW)	Losses (MW)	Demand (MW)

### 3. CALCULATION OF EMERGENCY THERMAL TRANSFER LIMITS

Transfer limit analysis was performed to establish “short-term” emergency thermal transfer limits for thermally-constrained interfaces. The analysis was performed on the Horizon Year Trial 9 power flow case described in Section 2 of this report.

#### 3.1 Methodology

Emergency transfer limits were established using the Linear FCITC Calculation tool in the PSS<sup>TM</sup>MUST Program (version 10.2).

The emergency transfer limit is the transfer level at which:

- a branch is loaded at its normal rating (Rate A) for pre-contingency conditions, or
- a branch is loaded at its short-term emergency rating (Rate C) following a contingency

For the purposes of this analysis, transmission facilities rated 100 kV and above within NYCA (and tie-lines out of NYCA) were monitored. Engineering judgment was used to identify limiting transmission facilities. Generally, “direct tie” facilities or facilities in the vicinity of the interface being studied that became loaded at their Rate A or Rate C ratings as described above were flagged.

Interface definitions are shown in Appendix A.

The following types of contingencies were simulated based on the contingency files provided by NYISO. In addition to these contingencies, other contingencies provided by National Grid associated with wind generation in the North Country were simulated.

1. Outage of branches connected between buses with a base voltage of 100 kV and above (these included outages based on “automatic” N-1 contingency specification<sup>1</sup> in MUST and specific pre-defined branch outages)
2. Generator outages
3. Series element contingencies
4. Bus contingencies
5. HVdc contingencies

---

<sup>1</sup> Automatic N-1 contingencies were not simulated in the Con Edison system.

Phase angle regulators maintain their scheduled power flow pre-contingency but are fixed at their corresponding pre-contingency angle post-contingency.

### 3.2 Results

Table 3-1 summarizes the emergency thermal transfer limits obtained from the MUST analysis (full MUST output for the various interfaces is provided in Appendix B). Limits are rounded down to the nearest 25 MW.

Limits for the upstate interfaces were calculated without making any adjustments to the base case. Limits for the downstate interfaces are sensitive to phase angle regulator settings in Con Edison and LIPA and were calculated as described below:

Interface limits for the UPNY-SENY, UPNY-ConEd Open, Millwood South Closed, Dunwoodie South Open and I-to-J interfaces were calculated based on the following assumptions (same assumptions as in reference [1]):

- Sherman Creek PAR1 and PAR2 are scheduled at 200 MW each into NYC.
- Parkchester PAR1 and PAR2 are scheduled at 245 MW each into NYC.
- Dunwoodie North PAR1 and PAR2 are scheduled at 115 MW each into NYC.
- Dunwoodie South PAR1 and PAR2 are scheduled at 120 and 115 MW respectively into NYC.

Limits for the “I to K” and “Long Island Import” interfaces were computed by making the following adjustments:

- Neptune HVDC is scheduled at 600 MW into LIPA.
- Cross Sound Cable is scheduled at 330 MW into LIPA.
- Northport PARs are scheduled at 450 MW into LIPA.
- Jamaica – Lake Success PAR is adjusted at 85 MW into LIPA.
- Jamaica – Valley Stream PAR is adjusted at 90 MW into LIPA.
- EGC PAR1 and PAR2 are scheduled at 318 MW each into LIPA.
- Resulting base case flow on Y50 (Dunwoodie – Shore Road 345 kV) is 640 MW.

Table 3-2 compares the transfer limits from the Trial 9 case against the corresponding limits from the BTP case (see reference [1]). In general, the following observations are made from Table 3-2.

1. The limits for the Volney East interface exhibited a 5% decrease going from the BTP case to the Trial 9 case (200 MW decrease). This can be explained as follows. Compared with the Trial 9 case, more power can be transferred across the Volney East interface in the BTP case before the limiting facility (Fraser - Coopers Corners 345 kV) becomes overloaded.

This is because the Marcy - Princetown - New Scotland 345 kV and the Leeds - New Scotland #3 lines in the BTP case facilitate higher west-to-east transfers across this interface compared with the Trial 9 case (these 345 kV lines are not present in the Trial 9 case).

2. The Moses South interface exhibited a decrease of 45% in the emergency thermal transfer limits. This is because the Moses-Marcy 345 kV lines in the BTP case are substituted with the existing Moses-Porter 230 kV lines in the Trial 9 case. It should be noted that the facility that determines the emergency transfer limit for this interface is: Marcy 765/345 AT1 for loss of AT2<sup>2</sup>. This is a valid limitation considering that the post-contingency loading on AT1 is 1756 MVA (which is less than the 1866 MVA required to trigger SPS action<sup>3</sup>).
3. The Central East interface exhibited a 1200 MW decrease in the emergency thermal transfer limits with respect to the BTP case. This is attributed to the removal of the Marcy - Princetown - N. Scotland 345 kV line and the New Scotland – Leeds #3 line from the BTP case (these two 345 kV lines together facilitated high transfers across this interface). This explains the reduction in the emergency thermal transfer limit.
4. The Central East+Fraser-Gilboa and CE Group interfaces exhibited a 375 MW decrease in emergency transfer limits for the same reasons as in item (3) above. In addition, the removal of the Oakdale – Fraser #2 line in the Trial 9 case moves the limiting facility for this interface from the Fraser – Coopers Corners 345 kV line (BTP case) back to the New Scotland 77 – Leeds 345 kV line (Trial 9 case).
5. The F-to-G interface exhibited a 725 MW reduction in emergency thermal transfer limits. The removal of N. Scotland - Leeds #3 line in the Trial 9 case moves the limiting constraint for this interface to the existing New Scotland 77 - Leeds 345 kV line. The limiting facility in BTP case was Leeds - Pleasant Valley #1 for loss of Leeds – Pleasant Valley #3.
6. The UPNY-SENY interface exhibited a 325 MW reduction in emergency thermal transfer limits with respect to corresponding transfer limits in the BTP case. The removal of the Oakdale – Fraser #2 line and the N. Scotland – Leeds #3 line in the Trial 9 case moves the limiting constraint

---

<sup>2</sup> For the purposes of this calculation, the ratings of the Marcy 765/345 kV transformers were updated as follows based on feedback received from NYPA.

Old ratings: AT1 (Normal/LTE/STE) : 1488 / 1654 / 1654 MVA; AT2: 1488 / 1793 / 2338 MVA  
New ratings: AT1 (Normal/LTE/STE): 1488 / 1650 / 1756 MVA; AT2: 1488 / 1650 / 1971 MVA

<sup>3</sup> Following the loss of Marcy AT2, the SPS trips Marcy AT1 provided the loading on each phase of AT1 exceeds 1409A at 765kV ( 1866MVA). The SPS also cross-trips the Chateaugay – Massena and Massena – Marcy 765 kV lines.

for this interface to the existing New Scotland 77 – Leeds 345 kV line. The limiting facility in BTP case was Fraser – Coopers Corners 345 kV line.

7. Emergency transfer limits for the UPNY-ConEd Open interface exhibited a 700 MW reduction with respect to corresponding transfer limits in the BTP case. The absence of the Ramapo-Rock Tavern 345 kV line in the Trial 9 case pre-loads the Roseton – E.Fishkill 345 kV line for transfers into SENY. This reduces the emergency transfer limit on the UPNY-ConEd interface. Similar comments for the Millwood South Closed interface.
8. The emergency transfer limit for the I-to-K interface is identical to the corresponding limit derived previously<sup>4</sup>.
9. The LIPA Import interface showed a 575 MW reduction in the Trial 9 case compared to the BTP case. This is because the Trial 9 case does not have the Pleasant Valley – Ruland Road HVdc line where as the BTP case does.

---

<sup>4</sup> The limiting transfer for the I-to-K and LIPA Import interfaces is Y50 (Dunwoodie – Shore Road 345 kV). The limit is based on the MW rating for Y50 (653 MW).

1. Excludes Plattsburgh-Sandbar 115 kV line.
2. Excludes Jefferson-Ramapo 500 kV line.
3. Includes Hudson Transmission Project (HTP).
4. The limiting facility for the I-to-K and LIPA Import interfaces is Y50 (Dunwoodie – Shore Road 345 kV). The limit is based on the MW rating for Y50 (653 MW).

## 4. CALCULATION OF EMERGENCY VOLTAGE TRANSFER LIMITS

Emergency voltage transfer limits were calculated on the Horizon Year power flow case described in Section 2 of this report.

### 4.1 Methodology

Emergency voltage transfer limits were calculated using the PV Analysis tool of PSS/E™ (version 30).

The limits were calculated by preparing a series of power flow cases with increasing MW transfers across the interfaces being studied and subjecting them to severe (voltage-wise) contingencies. The monitored buses were then reviewed for violations of post-contingency minimum voltage criteria and/or voltage collapse.

The testing followed NYISO practices and procedures discussed in Attachment E of the NYISO Transmission Expansion and Interconnection Manual [5]. MW transfers were increased until the point of voltage collapse was reached. In power flow analysis, this point is the highest transfer level for which a solution can be achieved. There is no solution beyond this transfer level because there are no more dispatchable reactive power resources available to support the transfer. Upon plotting the specific bus voltage (y-axis) against the pre-contingency MW transfer level (x-axis), the impending voltage collapse can be identified as the knee point on the PV curve. Based on the maximum sustainable pre-contingency MW transfer (i.e. the transfer level for which a solution can be achieved post contingency; with any further increases in power transfer rendering the system un-solvable due to reactive power deficiency), a reduced pre-contingency transfer level based on a 5% safety margin is determined. This reduced transfer is then compared against the pre-contingency MW transfer level which corresponds to a post-contingency minimum voltage at the monitored buses. In order to ensure that a voltage-based transfer limit is computed with a margin of safety, the lower of the two power transfers (i.e. 95% of that corresponding to voltage collapse point or that obtained by applying the relevant post-contingency low voltage limit) is chosen as the voltage-limited interface maximum transfer level.

The following assumptions were made for the analysis:

1. Phase angle regulators (“PARs”), switched shunts and LTC transformers are modeled as regulating pre-contingency and non-regulating post-contingency.
2. SVC and FACTS devices are set to near zero pre-contingency and allowed to operate full range post-contingency.

## 4.2 Results

Table 4-1 summarizes the emergency voltage transfer limits for the Central East, Central East + Fraser-Gilboa and CE Group interfaces (see column highlighted in yellow). For comparison purposes, corresponding limits derived earlier with the BTP projects (reference [1]) are also summarized. Limits are rounded down to the nearest 25 MW. The last two columns summarize the differences between the two sets of limits both in MW and as a percentage of the BTP limits. The Plattsburgh-Sandbar 115 kV line is not included in the interface definitions.

Figure 4-1 shows the PV curves for the Central East interface at the New Scotland 99 bus for various post-contingency conditions. For each contingency, the post-contingency voltage at New Scotland 99 bus is plotted against the pre-contingency MW flow on the interface. The most limiting contingency is tower contingency TWR 34/42 (CE18). Note from the Figure 4-1 that for this particular contingency, the nose of the curve is approx. 2940 MW. The pre-contingency transfer that corresponds to 95% of 2940 MW is 2793 MW (rounded down to the nearest 25 MW, which gives 2775 MW). The post-contingency voltage at the 2775 MW transfer level is above the post-contingency low voltage limit (328 MW). Based on the above, the emergency voltage transfer limit for the Central East interface is 2775 MW.

**Table 4-1: Emergency Voltage Transfer Limits**

Interfaces	Post-Contingency Low (A)		95% Voltage Collapse (B)			Pre-Contingency Low (C)		Horizon Year Limit with BTP Trial 9 Min(A,B,C)	Horizon Year Limit with BTP		Diff with BTP Limits
	MW Flow	Limiting Facilities	MW Flow	Limiting Facility	Tip of Curve	MW Flow	Limiting Bus	MW Flow	MW Flow	Limiting Facility	(%)

## 5. CONSOLIDATION OF EMERGENCY THERMAL AND VOLTAGE TRANSFER LIMITS FOR CENTRAL EAST INTERFACE

Emergency thermal and emergency voltage transfer limits for the Central East, Central East + Fraser Gilboa and CE Group interfaces are consolidated and presented in Table 5-1. The more limiting of the two transfer limits is shown in the last column.

**Table 5-1: Consolidation of Central East Limits**

Interface	STARS Horizon Year Summer Peak Trial 9		
	Emergency Thermal Transfer Limit (MW)	Emergency Voltage Transfer Limit (MW)	Min (Thermal, Voltage)
Central East	2975	2775	<b>2775</b> (V)
Central East + Fraser-Gilboa	3350	3150	<b>3150</b> (V)
CE Group	5275	4875	<b>4875</b> (V)

(T) = Thermally-constrained

(V) = Voltage-constrained

Study transfer level - 3000.0 MW. Total violations: 24178  
 First violation - -1825.5 MW.

Study transfer. From GHI\_EXPORT To J\_IMPORT . Transfer level - 3000.0 MW

Violations report ordered by transfer capability. Total 24178 violations

# **Attachment #13**

**MW Impact Calculations**

# MW Project Impact Calculation for Base Transmission Plan Project (STARS Phase II)

## 1. LOLE Calculation for BTP Case

The Base Transmission Plan database was built based on original Replacement Transmission Plan (RTP) GridView database with following updates:

- Added BTP transmission facilities
- Added HTP project
- Updated emergency transfer limits (based on report "Calculation of Transfer Limits for Horizon Year with Base Transmission Plan Projects")
- Generic conventional generation units' connection points were adjusted to match NYISO economical database
- Added 6,000 MW of wind generation as in NYISO economical database

The LOLE for BTP case is 0.07 days/year. As expected it is below LOLE of 0.08 days/yr for RTP case.

## 2. MW Excess Calculation

### 2.a. Calculation Based on Zonal Peak Loads

In order to determine the MW capacity impact of the BTP project(s), new generation capacity will be reduced, proportionally to the peak load in all zones, and LOLE will be recalculated. Because LOLE varies in a non-linear fashion with the generation capacity (or load), this LOLE calculation is an iterative process involving either removal or addition of generation capacity until the NYCA's LOLE of 0.08 days/year (as in original RTP case) is reached. Then, the amount of capacity that was backed off will be the "MW Project Impact".

After several iterations, with 350 MW new generation capacity reduction, the NYCA LOLE reaches 0.08 days/yr as shown in Table 1. The New generation capacity before and after reduction are shown in Table 2. So the MW capacity impact of the BTP projects is 350 MW.

Table 1. Calculated LOLE for BTP cases With and Without Generation Reduction, Based on Zonal Peak Load Proportion

Zones	Horizon Year LOLE (days/year)	
	Base Transmission Plan Case	BTP Case with Reduced New Generation
A	-	-
B	0.02	0.03
C	-	-
D	-	-
E	0.04	0.06
F	0.00	0.00
G	0.07	0.07
H	-	-
I	0.06	0.07
J	0.06	0.07
K	0.07	0.08
<b>NYCA</b>	0.07	0.08

Table 2. New Generation Capacity for BTP Cases Based on Zonal Peak Load Proportion

Zone	Load (MW)	New thermal generation (MW)	
		Base Transmission Plan (BTP) case	BTP case with generation reduction

**2.b. Calculation Based on Zonal UCAP**

Instead of reducing generation based on zonal peak loads as in the above method, the zonal generation unforced capacity (UCAP) was used as a basis for the generation reductions. In other words, new generation capacity in each zone was reduced in proportion to the unforced generation capacity (UCAP) and LOLE was recalculated. See Table 4. Because LOLE varies in a non-linear fashion with the generation capacity (or load), this LOLE calculation is an iterative process involving reduction of generation capacity until the NYCA's LOLE of 0.08 days/year (as in original RTP case) is reached. Then, the amount of capacity that was backed off will be the "MW Excess".

After several iterations, with 400 MW new generation capacity reduction, the NYCA LOLE reaches 0.08 days/yr as shown in Table 3. The new generation capacity reduction are shown in Table 4. So the MW capacity impact of the BTP projects is 400 MW.

# MW Excess Calculation for Base Transmission Plan Trial 9 Case (STARS Phase II)

## 1. LOLE Calculation for Base Transmission Plan T9 Case

The Trial 9 case includes the following BTP facilities:

- Leeds-Pleasant Valley 345kV line #3
- National Grid 115kV transmission upgrades

The LOLE for Trial 9 case is 0.074 days/year.

## 2. MW Project Impact Calculation

In order to determine the MW capacity impact of the Trial 9 projects, new generation capacity was reduced and LOLE recalculated. Zonal generation unforced capacity (UCAP) was used as a basis for the generation reductions. In other words, new generation capacity in each zone was reduced in proportion to the unforced generation capacity (UCAP). Because LOLE varies in a non-linear fashion with the generation capacity (or load), this LOLE calculation is an iterative process involving reduction of generation capacity until the NYCA's LOLE of 0.08 days/year (as in the Scenario 3A case) is reached. Then, the amount of capacity that was backed off is the "MW Excess".

After several iterations, with 270 MW new generation capacity reduction, the NYCA LOLE reaches 0.08 days/yr. See Table 1. The new generation capacity reductions are shown in Table 2. So the MW capacity impact of the Trial 9 projects is 270 MW.

**Table 1: Calculated LOLE for T9 cases with and without generation reduction, based on zonal UCAP proportion**
