# 1 INTRODUCTION

The New York Strategic Transmission Assessment and Reliability Study Working Group<sup>1</sup> (STARS WG) commissioned a Long Term Transmission Planning study for the New York State's electric transmission system. During this study, several issues such as reliability, aging facilities, economical alternatives, regulatory initiatives, integration of renewable resources are taken into consideration. The results from these plans and analyses are intended for developing a coordinated and well planned transmission system expansion as well as investments to be made by individual New York Transmission Owners (NYTOs) to meet the overall NYCA requirements over the next 20 to 30 years range.

A conceptual view of this Long Term Transmission Plan Development is shown here pictorially.

<sup>1</sup> Central Hudson Gas & Electric Corporation ("Central Hudson"), Consolidated Edison Company Of New York, Inc. ("Con Edison"), Long Island Power Authority ("LIPA"), National Grid ("National Grid"), New York Power Authority ("NYPA"), New York State Electric And Gas Corporation ("NYSEG"), Orange & Rockland Utilities, Inc. ("O&R") and Rochester Gas & Electric Corporation ("RGE")

As shown in the above figure, long-term transmission plans were developed based on several considerations such as System Reliability, Condition Assessment Analysis, Economic Analysis and Integration of Renewable Resources.

The subject of this initial report is Reliability Analysis which is the determination of transmission requirements from a transmission system security and reliability perspective. It should be noted that analyses pertaining to Condition Assessment, Renewable Resources and Economic Considerations were performed separately by representatives from all the participant companies and the NYISO. The findings of these other studies will be discussed in another report.

**Phase-II Study:** The Phase-I of the Reliability was completed in January 2010. The Phase-1 study results<sup>2</sup> are based on resource capacity, other assumptions and data available at the time the STARS Study started in February 2009. Since then, there have been substantial new resources proposed in the downstate as well as in the upstate zones. Several projects have either completed the interconnection process, have entered the class year 2009 or are expected by the NYISO to enter the 2010 class year studies which are scheduled to begin during spring of year 2010 and complete cost allocation by the first quarter of 2011. Acceptance of class year cost allocation suggests a project with high likelihood of realization. But, as in past class year studies, proposed projects may also drop out. This new information (over 3,000 MW of potential generation in downstate), if included in the calculation of LOLE, will result in reduction of transmission needs. The potential for such resource development (about 3,800MW) in the downstate is considered specifically as Scenario 1, but not in the other Scenarios of Phase-I of the study.

Based on the above situation and the information available (as of February 2010), the STARS Executive Committee and the STARS TWG considered that it is prudent to include the following two new generation facilities and re-compute the transmission MW needs<sup>3</sup> :

- 1) Astoria Energy II base at the same location where the retired Poletti was interconnected.
- 2) Solar Farms in Zone K.

In addition, new retirements and additions to the transmission network were also included in various Phase-II Tasks.

---

<sup>2</sup> Particularly Table 9-8 is of interest here, New York State Transmission Assessment and Reliability Study (STARS) Phase 1 Study Report – “As Is” Transmission System; January 13, 2010.

<sup>3</sup> Update of Table 9-8 of Phase-I report for Scenarios 2, 3 & 4, since the additional MW needs for Scenario-1 in this table was zero.

## 2 SCENARIO UPDATE

The basis used by STARS-TWG for developing the four Scenarios (or book-end possibilities of new resources) is shown in Table 2-1 of the Phase-I Report. The new generation Capacity, including imports from external areas, for the four Scenarios by individual zones is included in Table 2-1 of the Phase-I Report. The two major recent generation additions, noted earlier, are in Zones J and K. Because, the premise for Scenario-1 was that 85% of the new generation is to be located in down-state; the two major generation projects are already included in Scenario-1 by default. Hence, it is not necessary to modify Scenario-1 generation allocation and assumptions or repeat LOLE calculations. Thus, the generation capacity additions and retirements were used to modify the three remaining Scenarios (Table 2-1) as follows:

1. Add new 550 MW generator Astoria Energy II to East 13<sup>th</sup> Street 345-kV buses (#126275 and 126274):
  - The new Astoria Energy II unit has the same characteristics (heat rate, forced outage rate, maintenance duration) as existing Astoria Energy I (at bus # 126710)
  - Add new Charles Poletti 345-kV bus #147829 and connect to buses 126275, 126274, 126667, 126668, 126669
2. Add new BP 50 MW Solar Farm to LIPA area
  - 32 MW Solar Farm to Brookhaven 69-kV bus #129790 with hourly production curve, provided by LIPA
  - 18 MW Solar Farm to Ruland Road 138 kV bus # 129361
3. Retire two generating units in Zone C:
  - 53 MW unit Greenidge 3 at bus # 131313
  - 42 MW unit Westover 7 (aka Goudey) at bus # 131104

4. New generation capacity for Horizon year

- With 65% capacity credit, the new Solar Farms have effective capacity of 32.5 MW.
- Adding the new units and including retirements, reduced the New capacity requirement (Table 2-4 , Phase I report) from 5,015 MW to 4,528 MW ( $=5015-550-32.5+53+42$ ).

The new revised capacity requirement of 4,528 MW for the three Scenarios (#2, #3 & #4) was allocated according to the Scenario definition in Table 2-1 of Phase I report. Further, the additional generation was allocated to each zone in proportion to the zonal load. Generic 250MW units with 6% forced outage rate (FOR) are assumed for the new generation, unless only smaller amounts are indicated. The new generation units assumed for the three Scenarios are shown in Table 2-1.

The remaining Sections of this report are grouped into two parts followed by conclusions:

1. Part-I TRANSFER LIMIT CALCULATIONS
2. Part-II LOLE CALCULATIONS

## **PART I – TRANSFER LIMIT CALCULATIONS**

### 3 DEVELOPMENT OF POWER FLOW MODEL

This section summarizes the steps taken to update the power flow model of New York State Transmission System for Intermediate Year summer peak load conditions.

The power flow model used for Phase-I tasks was updated by adding the following facilities:

1. Stimulus / planned capacitor banks based on input from NYTOs.
2. Astoria Energy II generating station in the Con Edison system.
3. Upton solar farm in LIPA system.
4. Retirements identified by the NYISO.
5. Miscellaneous modeling changes identified by the NYISO and NYTOs.

Table 3-1 summarizes the capacitor bank additions. The capacitor banks were represented as switched capacitors in PSS/E and connected directly to the buses shown in the table. Additionally, National Grid indicated that there will be 300 MVAR of reactive compensation funded through the Federal stimulus program. This 300 MVAR will be on the distribution system in the Northeast region for the National Grid system and there will not be any capacitor banks connecting to the transmission system. This reactive compensation is adjusted in the load model for the power flow case by scaling down the reactive component of the Zone F load by 300 MVAR.

The 550 MW Astoria Energy II plant was added at the East 13<sup>th</sup> Street 345 kV bus (buses 126274 and 126275 in PSS/E) through a new Charles Poletti 345 kV bus. The following redispatch was assumed accommodate this generating station:

- 470 MW against the Rainey Gas Turbines (buses 126736, 126737, 126738, 126739, 126677, and 126678) and Astoria East GTs (buses 126311, 126312, 126322, 126323, 126325 and 126326).
- 80 MW against the following generators in the Con Edison system: ASTGT5 (bus 126712), ASTGT7-8 (126713), AWGT1 (126254) and AWGT2 (126255).

The two solar farms were modeled at full output by adding a 32 MW generator at the Brookhaven 69 kV bus (129790) and an 18 MW generator at the Ruland Road 138 kV bus (129361). The solar farm output was dispatched against other generators in the LIPA system. A lagging power factor of 0.988 was assumed i.e., the solar farm draws a small amount of reactive power from the grid.

The following retirements were modeled in the power flow case:

- 93 MW in Zone C Central: GOUDEY 7 (bus 131104), GRNIDG 3 (131313). This reduction in generation was offset by scaling up of other generators in Zone C.

The following miscellaneous modeling changes were applied to the case:

- Corrected the charging on the Lafayette – Lapeer 345 kV line to 0.36 pu on system base
- Added second Sugarloaf 138/69 kV transformer in Con Edison system (buses 146773 and 146809)
- Impedance of second Sugarloaf-Ramapo 138 kV line changed to  $R = 0.00043$  pu;  $X = 0.00234$  pu on system base
- Renamed Poletti Expansion Project (buses 147788 through 147790) to “NYPACC1/2”
- Renamed the in-service combined-cycle plant at buses 126673, 126692, 126710 and 126711 to Astoria Energy 1.

The case was solved with phase angle regulators, switched shunts, LTC transformers and area interchange enabled.

The above modeling changes resulted in a slight reduction in system losses. Loads in the individual NYCA zones (areas 1 through 11) were adjusted slightly such that the zonal demands (i.e., load + losses) match the corresponding summer peak 2018 values in Table I-2A of the 2008 Gold Book. Total NYCA Load + Losses = 37,130 MW. Area interchanges were not changed.

Table 3-2 lists the NYCA generation, load and losses in the updated power flow model.

## 4 SECURITY ANALYSIS FOR INTERMEDIATE YEAR

This section presents results obtained from steady-state analysis of the New York State Transmission System for Summer Peak load conditions in the Intermediate Study Year. System performance is evaluated under all-lines in and contingency case conditions and checked against New York State Reliability Criteria.

### 4.1 Methodology

Power flow analysis was performed on the Phase 2 intermediate year summer peak power flow case described in the earlier Section of this report. The analysis was performed using the AC Contingency Analysis tool in the PSS<sup>TM</sup>MUST program.

For the purposes of this analysis, transmission facilities rated 100 kV and above within NYCA (and tie-lines out of NYCA) were monitored.

For thermal overloads, each branch element (transformer, transmission line, or feeder in the monitored system) was monitored and electrical flows above the applicable branch rating (normal continuous rating - Rate A) under system intact conditions, LTE rating - Rate B) under contingency conditions for overhead transmission lines and STE rating (Rate C) for underground feeders) were flagged. Transmission interfaces were not monitored (thermal transfer limits for interfaces will be determined and presented separately in Section 5).

For bus voltage violations, the following range limits and pre-to-post-contingency voltage change criteria were applied:

- 0.95-1.05 pu for system intact conditions
- 0.90-1.10 pu for contingency conditions (0.95-1.05 pu in the Con Edison system)
- Voltage change criteria of 0.10 pu

In addition, several 230 kV and 345 kV buses identified by NYISO for special range limits were checked for voltage violations.

Phase angle regulators (PARs), switched shunts and LTC transformers are modeled as regulating pre-contingency and non-regulating post-contingency.

The following types of contingencies were simulated based on the contingency files provided by NYISO:

1. Outage of branches connected between buses with a base voltage of 100 kV and above (these included outages based on “automatic” N-1 contingency specification<sup>4</sup> in MUST and specific pre-defined branch outages)

---

<sup>4</sup> Automatic N-1 contingencies were not simulated in the Con Edison system.

2. Generation contingencies
3. Series element contingencies
4. Bus contingencies
5. HVdc contingencies

No stuck-breaker or tower contingencies were simulated.

In addition to these contingencies, other contingencies provided by National Grid associated with wind generation in the North Country were simulated

Appendix A shows the relevant subsystem description, monitored element and contingency description files used in this analysis (these files are the same as those used in Phase 1 of the STARS study).

Note: Some transmission facilities were excluded from monitoring based on input provided by NYCA transmission owners. Also, the transmission owners indicated that some of the automatic N-1 contingencies are not legitimate – these contingencies were excluded from analysis. See Appendix A.4 for a list of excluded monitored elements and contingencies.

## **4.2 Results**

### **4.2.1 System Intact Conditions**

Table 4-1 shows the overloaded transmission facilities for system intact condition. These violations were submitted to the transmission owners for review and following comments were received.

#### National Grid System:

National Grid provided the following comments:

- Overloads on Malone and Nicholville transformer banks can be mitigated by adding the Akwesanse 115/34.5 kV substation.
- The overloads on the Lawrence Ave 115/13.2 kV transformer banks need to be changed as follows: 22.4 MVA (Normal) and 27.7 MVA (LTE). This will mitigate the overloads.
- The overload on the Little River 115/23 kV transformer can be mitigated by changing the transformer ratings as follows: 12.1 MVA (normal) and 13 MVA (LTE).

The overload on the 115/11.5 kV transformer at Station 42 in the Rochester Gas & Electric System was also observed in Phase 1 of the study.

Table 4-2 lists system intact voltage violations. National Grid indicated that the overvoltage violations in Area 1 [*Areas 1 through 11 in the PSS/E power flow model correspond to Zones A through K in the Reliability Model*] are a consequence of high generation patterns in the southwest area. The overvoltages can be mitigated by generation redispatch. Similarly, it is anticipated that the overvoltages in Areas 2 and 3 can be mitigated through redispatch.

#### **4.2.2 Contingency Case Conditions**

Results of the contingency analysis showed several thermal and voltage violations. These are listed in Tables 4-3 and 4-4 and are described below.

Table 4-3 shows the overloaded transmission facilities. These violations were submitted to the transmission owners for review and comment.

##### NYSEG / RGE Systems:

NYSEG indicated that the overloads in the NYSEG and RGE systems are on underlying systems and that these facilities should be ignored when analyzing bulk power system limits. NYSEG requested that these facilities continue to be monitored for potential problems when wind generation is increased in the base case.

##### Long Island Power Authority System:

Each of the 345/138 kV New Bridge Road transformers becomes overloaded for loss of the parallel bank (15% overload based on the 585 MVA LTE rating). These transformers have a short-term capability of 801 MVA and the overloads can be mitigated by redispatching resources within the system. Also, a post-contingency overload of 3% was observed on the Brookhaven-Riverhead 138 kV line following the loss of the Shoreham-Wildwood 138 kV line.

##### National Grid System:

Several post-contingency overloads were observed in the National Grid system. National Grid indicated that most of these overloads are dispatch dependent and may be addressed by generation reduction. Specific National Grid comments are summarized below:

- The overloads on the Geres Lock-Solvay Tap and Menands-St. Campus 115 kV lines can be mitigated by upgrading the affected facilities with 795 A CSR conductors.
- The post-contingency overloads on the Leeds-Pleasant Valley 345 kV and Athens-Pleasant Valley 345 kV lines are dependent on dispatch and expected to decrease if Athens Generation is reduced. At present, there is a temporary SPS

in place for the contingencies that cause the overloads. Long-term solutions are being considered for resolving these overload problems.

- The overload on the Allens F – Colton 115 kV line is due to increase in the load and it will be necessary to re-conductor with 795 ACSR conductor to mitigate this violation. The structures on this line will have to be replaced to support the 795 ACSR conductor. This recommendation along with the support of the Akwesasne 115 kV substation will fix this issue.
- The following 115 kV lines can be re-conducted with 1113 ACSR. This together with long term solutions for Leed-Pleasant Valley 345 kV overload problem will mitigate the 115kV line overloads in Hudson Valley area.

Table 4-4 lists post-contingency voltage violations. These violations were submitted to the transmission owners for review. The following comments were received.

National Grid System:

National Grid indicated that the majority of the post contingency voltage violations are on the local 115 kV system due to high generation in the southwest area and certain 115kV line outages.

In the southwest area there are low voltage concerns due to certain 115 kV line outages. National Grid is currently developing a plan to mitigate this issue in the southwest. It involves interconnecting a new 345/115 kV substation to the Stolle Rd - Homer City 345 kV line. This transmission plan should be reviewed again when long term solutions are developed.

New York Power Authority:

New York Power Authority indicated that the following voltage violation should be ignored:

- PMLD 3 for the loss of PMLD 1 is a local issue.

**4.3 Summary**

The results presented in this section showed several security violations (thermal and voltage). It should be noted that these violations are for a typical generation dispatch i.e., for a snapshot of system conditions at a given instant in time – it may be possible to mitigate the violations through a combination of generation redispatch and transmission upgrades. Transmission solutions to mitigate these constraints will be developed as part of long term plan.

## 5 TRANSFER LIMITS FOR INTERMEDIATE YEAR

This section describes the calculation of transfer limits for key interfaces in the New York State Transmission System for summer peak load conditions in the Intermediate Year. The purpose of these calculations is to establish emergency transfer limits for use in subsequent LOLE analysis.

Transfer limits were computed based on the Intermediate Year power flow model described in Section 3 of this report. Both thermally-constrained and voltage-constrained interfaces are studied. The limits are then compared against corresponding limits derived in Phase 1 of the STARS study.

### 5.1 Calculation of Emergency Thermal Transfer Limits

#### 5.1.1 Methodology

Emergency transfer limits were established using the Linear FCITC Calculation tool in the PSS<sup>TM</sup>MUST Program (version 9.0).

The emergency transfer limit is the transfer level at which:

- a branch is loaded at its normal rating (Rate A) for pre-contingency conditions, or
- a branch is loaded at its short-term emergency rating (Rate C) following a contingency

For the purposes of this analysis, transmission facilities rated 100 kV and above within NYCA (and tie-lines out of NYCA) were monitored. Engineering judgment was used to identify limiting transmission facilities. Generally, “direct tie” facilities or facilities in the vicinity of the interface being studied that became loaded at their Rate A or Rate C ratings as described above were flagged.

The following types of contingencies were simulated based on the contingency files provided by NYISO. In addition to these contingencies, other contingencies provided by National Grid associated with wind generation in the North Country were simulated.

1. Outage of branches connected between buses with a base voltage of 100 kV and above (these included outages based on “automatic” N-1 contingency specification<sup>5</sup> in MUST and specific pre-defined branch outages)
2. Generator outages
3. Series element contingencies

---

<sup>5</sup> Automatic N-1 contingencies were not simulated in the Con Edison system. Also, some automatic N-1 contingencies in NYCA were excluded from analysis based on transmission owner input. See Appendix A.4 for a list of excluded monitored elements and contingencies.

4. Bus contingencies
5. HVdc contingencies

Phase angle regulators (PARs) maintain their scheduled power flow pre-contingency but are fixed at their corresponding pre-contingency angle post-contingency.

Appendix B shows the relevant subsystem description, monitored element and contingency description files used in this analysis (these files are the same as those used in Phase 1 of the STARS study).

Limits were evaluated in the predominant west-to-east/north-to-south direction based on source/sink assumptions provided by the NYISO in Phase 1 of the STARS study.

### 5.1.2 Results

Table 5-1 summarizes the emergency thermal transfer limits obtained from the MUST analysis for the cross-state interfaces (full MUST output for the various interfaces is provided in Appendix C). For comparison purposes, corresponding limits from Phase 1 of the STARS study are also summarized. The last two columns summarize the differences between the two sets of limits both in MW and as a percentage of the Phase 1 limits.

As in the Phase 1 study, transfer limits for the upstate interfaces were calculated without making any adjustments to the base case. Limits for the downstate interfaces are sensitive to phase angle regulator settings in Con Edison and LIPA and were calculated as described below:

Interface limits for the UPNY-ConEd Open, Millwood South Closed, Dunwoodie South Plan and I to J interfaces were calculated with Con Edison PARs optimized based on input from Con Edison to regulate flows on the following branches:

- 126298 - 126301 (Sprainbrook to Tremont) – Increase from 400 MW to 480MW
- 126298 - 126847 (Sprainbrook to Academy) – Increase from 400 MW to 460 MW
- 126374 - 126485 (Dunwoodie South to East 179th Street) – Increase from 120 MW to 180 MW

Limits for the “I to K” interface were computed by adjusting the E. Garden City PARs to regulate the flow on the Y49 cable (Sprainbrook-EGC 345) to its maximum flow limit of 637 MW. The limiting facility for this interface is the Y50 cable (Dunwoodie-Shore Road 345). The power flow case shows a normal rating of 599 MVA for this facility while the limit is calculated based on a normal rating of 653 MVA<sup>6</sup>. As shown in Table 5-1, the interface limit of 1290 MW limit is based on the 653 MVA normal rating.

---

<sup>6</sup> LIPA indicated that the 599 MVA rating for Y50 is based on a 100% loss factor while the 653 MVA rating is based on a 70% loss factor and rapid oil circulation.

**Table 5-1: Emergency Thermal Transfer Limits**

Interface	Phase 1 limits		Phase 2 limits		Difference	
	MVA	Limit	MVA	Limit	MVA	%
Dysinger East	3266	1a	3237	1a	-29	-0.89%

7 Moses-Adirondack 230	440	L/O Massena-Marcy &Massena-Chateaguay
8 Roseton-Fishkill 345	1935	Pre-disturbance
10 Dunwoodie-Shore Rd 345	653	Pre-disturbance

Limits for the “Long Island Import” interface were calculated by adjusting the PARs controlling the LIPA import to allow for maximum emergency transfer capability into LIPA as follows:

	<u>Emergency</u>
Jamaica – Lake Success 138 kV	85 MW
Jamaica – Valley Stream 138 kV	90 MW
Sprainbrook – EGC 138 kV	637 MW
Norwalk Harbor 138 kV – Northport	450 MW <sup>7</sup>

The limiting facility for this interface is the Y50 cable (Dunwoodie-Shore Road 345). See Appendix C. As shown in Table 5-1, the interface limit of 2896 MW is based on the 653 MVA normal rating.

The limits shown in Table 5-1 are comparable to the limits derived in Phase 1 of the STARS study [2]. This makes sense because no additional transmission was added in Phase 2 and also the generation patterns in NYCA are similar to those in Phase 1.

## 5.2 Calculation of Emergency Voltage Transfer Limits

### 5.2.1 Methodology

Emergency voltage transfer limits were calculated using the PV Analysis tool of PSS/E™ (version 30).

The limits were calculated by preparing a series of power flow cases with increasing MW transfers across the interfaces being studied and subjecting them to severe (voltage-wise) contingencies. The monitored buses were then reviewed for violations of post-contingency minimum voltage criteria and/or voltage collapse.

The testing followed NYISO practices and procedures discussed in Attachment E of the NYISO Transmission Expansion and Interconnection Manual [3]. MW transfers were increased until the point of voltage collapse was reached. In power flow analysis, this point is the highest transfer level for which a solution can be achieved. There is no solution beyond this transfer level because there are no more dispatchable reactive power resources available to support the transfer. Upon plotting the specific bus voltage (y-axis) against the pre-contingency MW transfer level (x-axis), the impending voltage collapse can be identified as the knee point on the PV curve. Based on the maximum sustainable pre-contingency MW transfer (i.e. the transfer level for which a solution can be achieved post contingency; with any further increases in power transfer rendering the system un-solvable due to reactive power deficiency), a reduced pre-contingency transfer level based on a 5% safety margin is determined. This reduced transfer is then compared against the pre-contingency MW transfer level which corresponds to a post-contingency minimum voltage at the monitored buses. In order to ensure that a voltage-based transfer limit is computed with a margin of safety, the lower of the two power transfers (i.e. 95% of that corresponding to voltage collapse point or that obtained by

<sup>7</sup> Note: As per LIPA, the total NNC rating in the Intermediate and Horizon years would be 450 MVA.

applying the relevant post-contingency low voltage limit) is chosen as the voltage-limited interface maximum transfer level.

The following assumptions were made for the analysis:

1. Phase angle regulators (“PARs”), switched shunts and LTC transformers are modeled as regulating pre-contingency and non-regulating post-contingency.
2. SVC and FACTS devices are set to near zero pre-contingency and allowed to operate full range post-contingency.

For all interfaces voltage transfer limit calculations, the planned / stimulus capacitor banks were fixed to their maximum values. Downstate capacitor banks were maximized while computing the limits of Total East, Central East, CE+Fraser-Gilboa, CE-GROUP, F to G, UPNY-SENY, UPNY-ConED, Millwood South Closed, I to J+K, Marcy South and Volney East interfaces. In addition to maximizing the downstate capacitor banks, the phase angle regulators in the Con Edison system were modeled as described in Section 5.1.2.

Transfer limits were evaluated in the predominant west-to-east/north-to-south direction. Monitored buses and contingencies simulated for each interface are given in Appendix D.

## 5.2.2 Results

Table 5-2 summarizes the emergency voltage transfer limits on the Intermediate Year summer peak case described in Section 3.2 (detailed PV curves for each interface are given in Appendix D). For comparison purposes, corresponding limits from the STARS Phase 1 analysis are also summarized [2]. The last column shows the differences between the two sets of limits as a percentage of the Phase 1 limits.

As in the Phase 1 analysis, limits for Central East, CE+Fraser-Gilboa and CE-Group interfaces are shown with and without the Plattsburgh-Sandbar line included in the interface definitions. Total East interface limits were computed by including the Plattsburgh-Sandbar 115 kV line and the Linden VFT in the interface definition. UPNY-SENY interface includes the Jefferson-Ramapo 500 kV line in the interface definition.

Figure 5-1 shows the PV curves for the Dysinger East interface at the Rochester 345 kV bus for different contingencies. For each contingency, the post-contingency voltage at Rochester 345 kV is plotted against the pre-contingency MW flow on the interface. The most limiting contingency is the loss of Ginna generation (LOG02). Note from the Figure 5-1 that for this particular contingency, the nose of the curve is approx. 2712 MW. The pre-contingency transfer that corresponds to 95% of 2712 MW is 2576 MW.

Similarly, Figure 5-2 shows the PV curves for the West Central interface at the Rochester 345 kV bus for different contingencies. As before, the most limiting

contingency is the loss of Ginna generation (LOG02). The emergency voltage transfer limit is 1205 MW.

Note from Table 5-2 that there is a significant improvement in the Phase 2 emergency voltage transfer limits. This is a consequence of planned / stimulus capacitor additions.

### **5.3 Consolidation of Emergency Thermal and Voltage Transfer Limits**

Emergency thermal and emergency voltage transfer limits for the cross-state interfaces are consolidated and presented in Table 5-3. The most limiting of the two transfer limits is shown in the last column.

Table 5-2: Comparison of Phase I and II Emergency Voltage Transfer Limits

## **PART II – LOLE ANALYSIS**

## 6 LOLE AND TRANSFER MW NEEDS REVISION FOR SCENARIOS 2, 3 AND 4

In Phase 1, the LOLE results and subsequently interface transfer MW needs were calculated based on 2008 series powerflow case and RNA database. Results of the Phase 1 analysis showed that except for Scenario 1, where 85% of new generation is located down state, Scenarios 2, 3 and 4 all have LOLEs above the criteria of 0.1 day/year, and would require transmission capacity upgrades (Table 9-8, Phase 1 report).

After the completion of Phase 1, the list of approved generation and transmission projects were updated (see Section 2 of this report). The Phase 1 reliability model was updated and the LOLE for the modified Scenarios 2A, 3A and 4A were recomputed. This Section describes the updated LOLE and MW Need results for these 3 scenarios.

### 6.1 LOLE Index

GridView simulations were performed for three scenarios 2A, 3A and 4A and the LOLE indices were re-calculated. The result is shown in Table 6-1. The result shows that with 550 MW added to zone J and 32.5 MW effective solar capacity added to zone K, the LOLE indices reduced significantly for all the three scenarios: from 1.68 to 0.96 days/year for Scenario 2; from 0.2 to 0.08 days/year for Scenario 3 and from 0.44 to 0.36 days/year for Scenario 4.

**Table 6-1: Calculated LOLE values for Scenarios 2A, 3A and 4A.**

Zones	Horizon Year's LOLE (days/year)		
	Scenario 2A	Scenario 3A	Scenario 4A
A	-	-	-
B	0.34	0.03	0.12

K	1.02	0.08	0.38
<b>NYCA</b>	<b>0.96</b>	<b>0.08</b>	<b>0.36</b>

### 6.2 Additional Transmission Capacity

Since the updated Scenario 3A has an LOLE of 0.08days/yr, only Scenarios 2A and 4A would need additional transmission capacity. Using the methodology, described in Phase 1 report (Section 9.4), a series of sensitivity cases were simulated for Scenarios

2A & 4A. Additional transmission capacities were calculated (based on statistical average peak interface flow value) and result is shown in Table 6-2.

**Table 6-2: Transfer MW need**

\*\* - based on HQ-D non-emergency limit of 1200 MW

## 7 SENSITIVITY CASES

In Scenario 4A, the assumption is that 75% new generation resource is from external areas, especially 2267 MW of new generation from HQ. However, the transfer MW need calculation (emergency transfer for reliability purposes) did not show a need above the 1500 MW for the HQ to D interface (Table 6-2). The MW need values shown in the above Table (and in the Phase-I & II Reports) are calculated using the probabilistic approach. Further, the internal and external resources are assigned different priorities (as explained in Phase-I report). Thus, the probability of needing the all the external resources (simultaneously after exhausting internal resources) to meet the target LOLE is very low and hence the weighted average of the transfers across this interface is not more than the 1500MW for Scenario 4A.

However, from a deterministic view (or a power flow dispatch model) transmission capacity that is at least equal to the generation capacity is necessary, if all the external generation is dispatched. Further, economic dispatch of generation may justify much higher transmission capacity for this interface.

In order to illustrate the effect of the priority and other assumptions used in the LOLE calculations five different sensitivity cases were simulated. The results of five sensitivity simulations are shown in Table 7-1.

**Table 7-1: Scenario 4 Sensitivity**

Zones	Scenario 4 Sensitivity LOLE (days/year)						
	Case 4A	Case 4B	Case 4B1	Case 4C	Case 4D	Case 4E	Case 4F
A	-	-	-	-	-	-	-
B	0.12	0.12	0.13	0.05	0.07	0.06	0.05
C	-	-	-	-	-	-	-

<b>NYCA</b>	0.36	0.36	0.43	0.18	0.23	0.18	0.15

**CASE-4A:** In Scenario 4A (Case 4A in Table 7-1) all new external resource generators were modeled as new generation units actually connected to external area networks in HQ and PJM East, as shown in the bubble diagram (Figure 7-1). Because, these units are located within the external areas, these were utilized with priority level two, i.e. after exhausting all resources within the state.

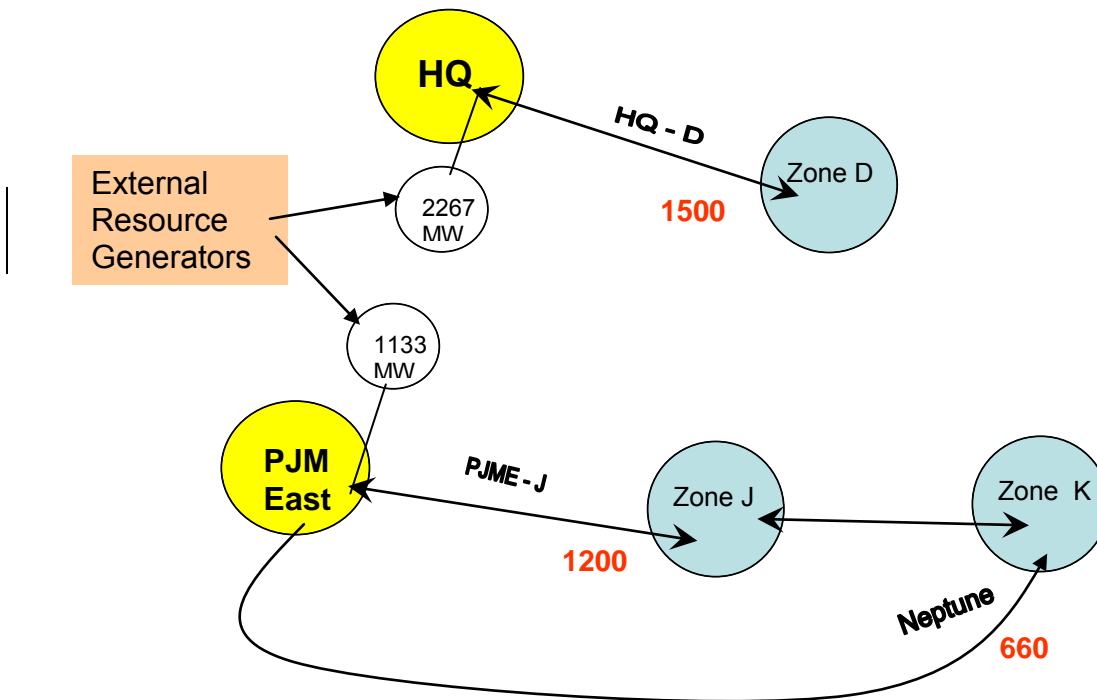

Figure 7-1. Bubble diagram of Case 4A

**Case 4B:** In Case 4A, the new units (even though physically connected to the external networks) are assumed to be dedicated to supply power to the New York state. Then, a question arises - if these units are dispatched with priority level one (same priority as the units within the state); instead of priority two as was done in Case 4A; would the LOLE increase? For answering this question, a sensitivity Case 4B was created with the new external units physically connected to NYCA areas as shown in bubble diagram (Figure 7-2). The steps used for creating Case 4B, starting from Case 4A are;

- Move 2,267 MW newly added generation (8 units of 250 MW and 1 unit of 267 MW) from HQ bus to fictitious bus within zone D, which is radially connected to bus: #147828 (MASS 765) 765kV
- Move 1,133 MW newly added generation (4 units of 250 MW and 1 unit of 133 MW) from PJM to fictitious zone J bus, which is radially connected to bus: #126304 (W 49TH ST) 345kV

The interface limits for this case are same as those used in Case 4A. The only change made is the priority for these external units form two to one. The calculated LOLE is same as in Case 4A, thereby confirming that the priority assignment or assumption did not affect the reliability calculations.

Figure 7-2. Bubble diagram of Case 4B

**Case 4B1:** In the above case, the 1133 MW (located in PJM) was directly connected to Zone-J. But, a part of this capacity may be assigned to zone-K. For evaluating such a division of this external resource, the 1133MW in PJM is split into two parts (as shown in Figure 7-3):

- a) Move 770 MW newly added generation (2 units of 250 MW and 1 unit of 270 MW) from PJM to fictitious zone J bus, which is radially connected to bus: #126304 (W 49TH ST) 345kV, and
- b) Move newly created 363 MW unit to zone K bus #128842 (NEPTCONV) 345kV

The LOLE of 0.43days/year for case 4B1 is a bit higher, because the 363 MW was directly connected to zone K, but the PJME-K limit (base loaded dc interface) was not increased to accommodate it, so it is equivalent to Case 4B with 363 MW PJM import generation being not available when the Neptune dc is fully loaded.

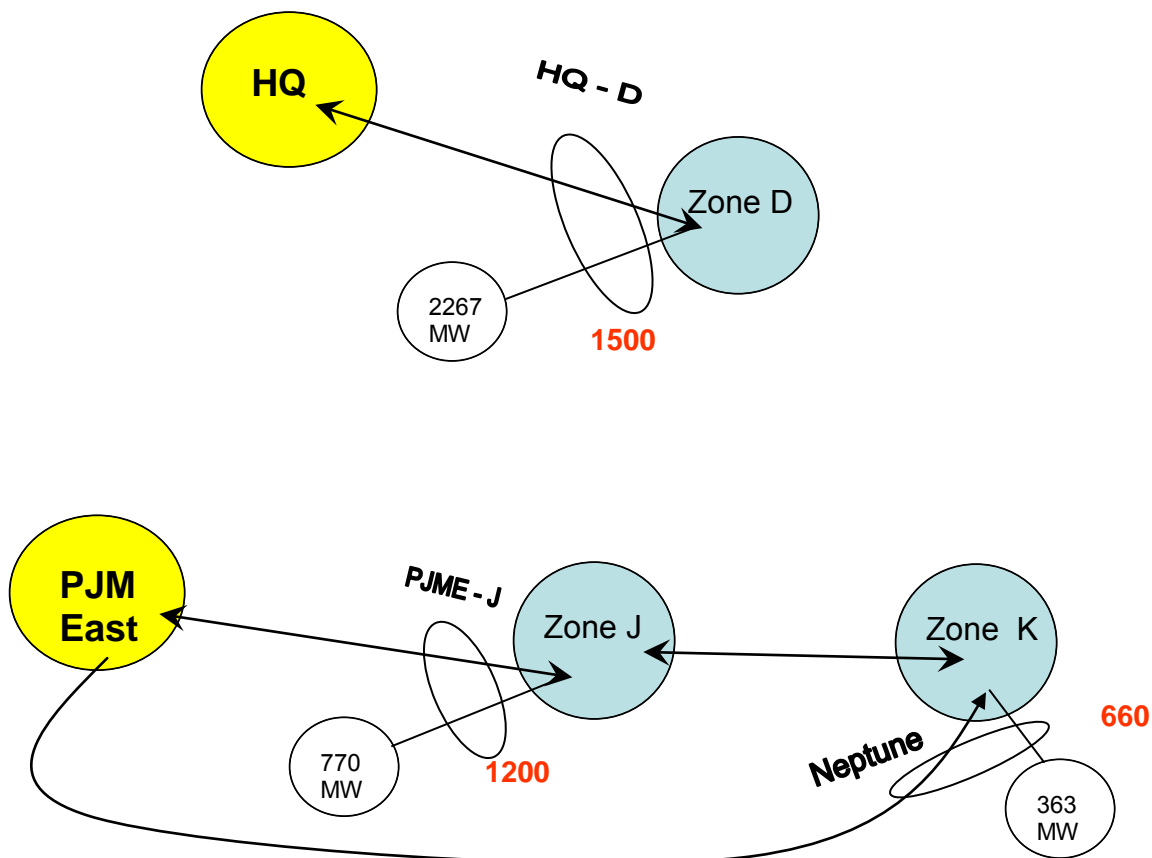

Figure 7-3. Bubble diagram of Case 4B1

**Case 4C:** If a large amount of new and economical generation is located in the external areas; then it is conceivable that these resources will be dispatched to the maximum extent. Consequently, the import interfaces, namely, HQ-D, PJME-J and PJME-K may be upgraded, on the basis of economics, to accommodate the ensuing power flows. Any such upgrade would also be useful for reliability purposes as well. For establishing the degree of reliability improvement due to any such import interface limit increase, another Case 4C was created from Case 4B1 plus three import interface limit upgrades:

- HQ-D from 1500 MW to 3400 MW (increase of 1900 MW)
- PJME - J from 1200 MW to 1970 MW (increase of 770 MW)
- PJME - K from 660 MW to 1023 MW (increase of 363 MW)

The bubble diagram of case 4C is shown in Figure 7-4. The calculated LOLE for this case is 0.18 days/year (Table 7-1). Even though, the LOLE decreased, as expected, the reliability benefit (or LOLE reduction) itself is not that significant as compared the level of interface upgrades assumed for this case.

Figure 7-4. Bubble diagram of Case 4C

**Case 4D:** Based on Phase-I results and comparison of LOLE for Cases 4B and 4B1; the importance of supporting zone-K for reliability improvement either thru' direct embedded generation within the zone or increasing the import interface limit is evident. Further, in Case 4C the smallest upgrade assumption is for the PJM-E to zone-K interface. For determining the reliability benefit of upgrading this interface, another sensitivity case was created by increasing the PJME - K transfer limit from 660 MW to 1023 MW (increase of 363 MW). Cases 4B1 and 4D results showed that by increasing this interface limit from 660 MW to 1023 MW, the LOLE reduced from 0.43 to 0.23days/yr, a substantial benefit as compared to the amount of limit increase.

**Case 4E:** For Case 4C, the calculated value for NYCA LOLE is 0.18days/yr. This is above the target of 0.1day/yr and hence, there is still some MW need requirement not fulfilled for internal interfaces. Upto the previous sensitivity Case 4D, the interface transfer limits used were from Phase-I Report. Since then, these transfer limits have been re-computed (Phase II Report-Section 5). The recalculated transfer limits are a bit higher for many of the interfaces. Hence, LOLE was recalculated using the revised/updated new interface limits. A new Case 4E was created from Case 4C plus revised NYCA interface limits, as calculated in Phase II (Section 5 of this report).

The calculated LOLE of 0.18day/yr showed that the new (somewhat higher) interface limits did not reduce NYCA LOLE.

**Case 4F:** The LOLE for Case 4E is still above the limit. Since LOLE variation is highly non-linear and very sensitive to small changes, the amount of new generation needed to bring the LOLE to the desired target of 0.1day/yr was determined. Instead of using a very precise looking number, such as 363MW for increased transfer limit from PJME to K, this limit was rounded up to 400 MW. Previous Case 4E was modified by increasing the PJME – K interface limit by 37 MW to 1060 MW (=1023+37). The calculated NYCA LOLE for this case is 0.15 days/year close the reliability criterion.

In order to connect some of the wind generation to the bulk power system it is necessary to upgrade the transmission system. The NYISO Wind Study has analyzed the specific upgrades necessary to reduce or eliminate congestion that limits the energy output of the added wind generators. The list below shows some of these upgrades and their associated cost. The list is not all inclusive as some of the larger upgrades eliminate the need for some smaller upgrades. The Wind Study describes each upgrade in great detail.

## Possible Transmission Upgrades Necessary for “Unbottling” of Wind Generation

Transmission Path or Device	Voltage Level	Upgrade	Approximate Cost (M\$)
Moses-Willis	230 kV	Tower Reconfiguration	2.0
Canandaigua-Hillside& Hillside-Watercure	230 kV	Tower Reconfiguration	2.0
Oakdale-Fraser & Oakdale-Lafayette	230 kV	Tower Reconfiguration	2.0
Montour Falls-Hillside	115 kV	Conductor	20.9
Hillside-North Waverly	115 kV	Conductor	17.5
Canandaigua-Avoca-Hillside	230 kV	Conductor	1.0
(2) Plattsburgh	230/115 kV	Transformers	-
Willis-Plattsburgh	230 kV	Conductor	-
Delhi-Colliers	115 kV	Conductor	0.8
Black River-Taylorville-Lowville	115 kV	Conductor	0.6
Bennett-Howard-Bath-Montour	115 kV	Conductor	3.0
Bennett-Moraine-Meyer	115 kV	Conductor	2.0

Lighthouse Hill-Mallory	115 kV	Conductor	41.9
Coffeen Street-East Watertown Coffeen Street-Black River Lyme Tap –Coffeen Street	115 kV	Conductor & Towers	10.3
Meyer-Eel Pot Rd-Ecogen-Flat St- Greenidge	115 kV	Conductor	16.0
Plattsburgh	230/115 kV	Transformers	15.0
Taylorville-Boonville	115 kV	Conductor & Terminals	120.9
Black River-North Carthage Black River-Taylorville North Carthage-Taylorville	115 kV	Conductor	38.7
Coffeen Street-Black River	115 kV	Conductor & Station	9.2
Indian River-Black River	115 kV	Bus & Station Connections	0.5
Rockledge Tap-Lyme Tap-Coffeen St Coffeen St-Black River	115 kV	Conductor	24.5
Coffeen Street-Adirondack	230 kV	New Circuit	90.0-133.6

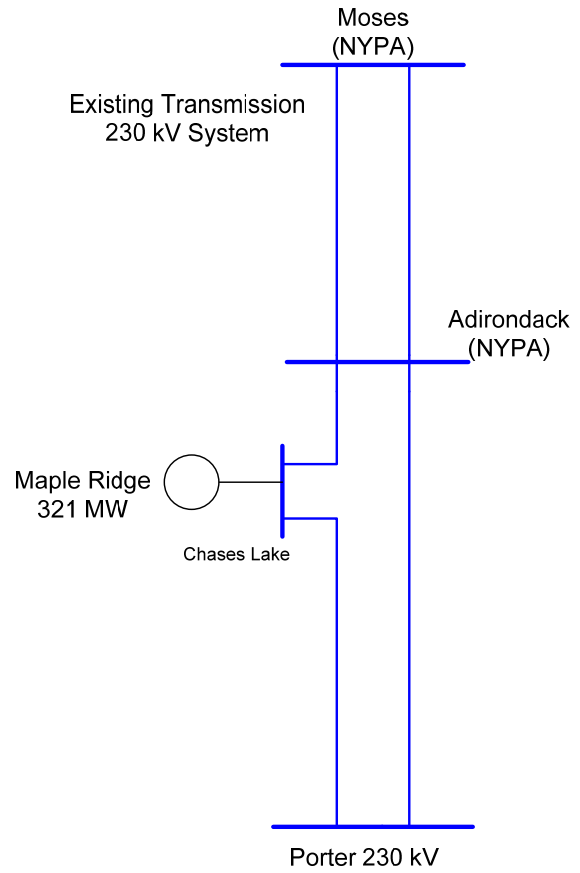

As part of the STARS Base Transmission Plan, the Moses-Adirondack-Porter 230 kV transmission path is upgraded to 345 kV. The Wind Study transmission upgrade at Adirondack includes a 115/230 kV transformer to connect increased wind generation into the 230 kV system. Rather than adding a 230/345 kV transformer to the Wind Study configuration, the STARS study simply replaced the 115/230 kV transformer with a 115/345 kV transformer to connect the wind generation with the new 345 kV STARS transmission configuration. The proposed change eliminates the cost of an additional transformer and the added impedance of two step-up transformers between the Watertown wind generation and the bulk power system.

The three diagrams below show the existing, Wind Study, and STARS transmission configurations in the Watertown area.

DRAFT - For Discussion Purposes  
Only

# Topics

- Proposed Model Updates
- New HQ Model Development
- New HQ Model Results

# Proposed Model Updates

- National Grid Leeds-Athens-Pleasant Valley & Leeds Pleasant Valley BTP Line Impedance Corrections

# New HQ Model Development

- Load/Generator Pair
- HQ Load
  - Hourly resource with negative generation
  - Shape mimics HQ hourly loads in 2008 (winter peaking condition, adjusting the peak load to 1000).
- HQ Generation
  - 7-block heat-rate thermal generation
  - Monthly fuel prices adjusted to match the monthly target energy based on 2.5 year historical data
- Total HQ import in RIK case ~ 5000 GWh/year based on historical data
- Wheeling through NYISO not modelled

# New HQ Model Development

- Simulation Case Progression
  - Fixed Schedule HQ Model w/ 1200 MW Limit
  - Price Flexible HQ Model w/ 1200 MW Limit
  - Price Flexible HQ Model w/ 1380 MW & 1800 MW Limits
    - Results Provided through 12/06 Email
  - Price Flexible HQ Model w/ 1380 MW & 1800 MW Limits w/ Total Energy Corrected
  - Price Flexible HQ Model w/ 1380 MW & 1800 MW Limits w/ Total Energy Corrected & Hurdle Rate Limits/Penalties Adjusted

# New HQ Model Results

- Price Flexible HQ Model w/ 1380 MW & 1800 MW Limits
- Production Cost Savings when Adding BTP:

*NYISO Savings Due to BTP*

<b>STARS Case</b>	<b>Production Cost Savings (M\$)</b>	<b>Import Cost Savings (M\$)</b>	<b>Emissions Cost Savings (M\$)</b>	<b>Total NYISO Production Cost Savings (M\$)</b>	<b>Load LBMP Payment Savings (M\$)</b>

# STARS Base Transmission Plan Trials Results – “Reference Case” – National Grid Cost Updates

(B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

Trial	Benefit (M\$)	Cost (M\$)	B/C Ratio (M\$)	Benefit - Cost (M\$)	Inc Benefit (M\$)	Inc Cost (M\$)	Inc B/C Ratio (M\$)
Initial (BTP)	199	597	0.33	-398	-	-	-
T1	197	456	0.43	-259	-	-	-
T2	176	402	0.44	-226	-	-	-
T3	175	261	0.67	-86	-	-	-
Incremental Marcy – Moses Benefit (T3 to T4):					-1	48	-0.02
T4	176	213	0.83	-37	-	-	-
T5	192	394	0.49	-202	-	-	-
Incremental Oakdale – Fraser Benefit (T4 to T6):					32	43	0.74
T6	144	170	0.85	-26	-	-	-
Incremental Marcy/PT/N. Scotland Benefit (T6 to T7):					18	62	0.29
T7	126	108	1.17	18	-	-	-
Incremental Ramapo – Rock Tavern Benefit (T7 to T8):					32	28	1.15
T8	94	80	1.18	14	-	-	-
Incremental New Scotland – Leeds Benefit (T8 to T9):					19	31	0.61
T9	75	48	1.55	27	-	-	-
T10	162	151	1.07	11	-	-	-
Incremental New Scotland – Leeds Benefit (T12 to T14):					30	24	1.26
T14	87	118	0.74	-31	-	-	-
T15	107	146	0.73	-39	-	-	-
T16	2	48	0.04	-46	-	-	-
Incremental Marcy/PT/N. Scotland Benefit (T4 to T10):					14	62	0.23
Incremental New Scotland - Leeds Benefit (T6 to T15):					37	24	1.55
Incremental Ramapo – Rock Tavern Benefit (T6 to T12):					27	28	0.97
Incremental Marcy/PT/N. Scotland Benefit (T8 to T12):					-23	-62	0.37
Incremental Marcy/PT/N. Scotland Benefit (T9 to T14):					-12	-70	0.17
Incremental Oakdale – Fraser Benefit (T10 to T7):					36	43	0.83
Incremental Ramapo – Rock Tavern Benefit (T14 to T15):					-20	-28	0.72

### Notes:

- Each trial is depicted as a node with red nodes denoting trials with B/C < 1, and green with B/C > 1.
- A red arrow denotes that the B/C ratio decreased implying that more benefit than cost was removed, not a good outcome. A green arrow denotes the reverse, that more cost than benefit was removed, a good outcome.

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

## STARS Base Transmission Plan Trials Results – “4,250 MW Wind” Scenario (B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

Trial	Benefit Under 4,250 MW Scenario (M\$)	Cost (M\$)	B/C Ratio (M\$)	Reference Case Benefit (M\$)	Delta Benefit Change (M\$)
Initial (BTP)	180	597	0.30	199	-19
T3	167	261	0.64	175	-8
T4	170	213	0.80	176	-6
T6	141	170	0.83	144	-3
T14	86	118	0.73	87	-1

### Notes:

- Overall, the “4,250 MW Wind” scenario lowers slightly the benefits of the transmission system upgrades (all trials).
- Highlight, the BTP trial benefits drop by 10% or 19 M\$.

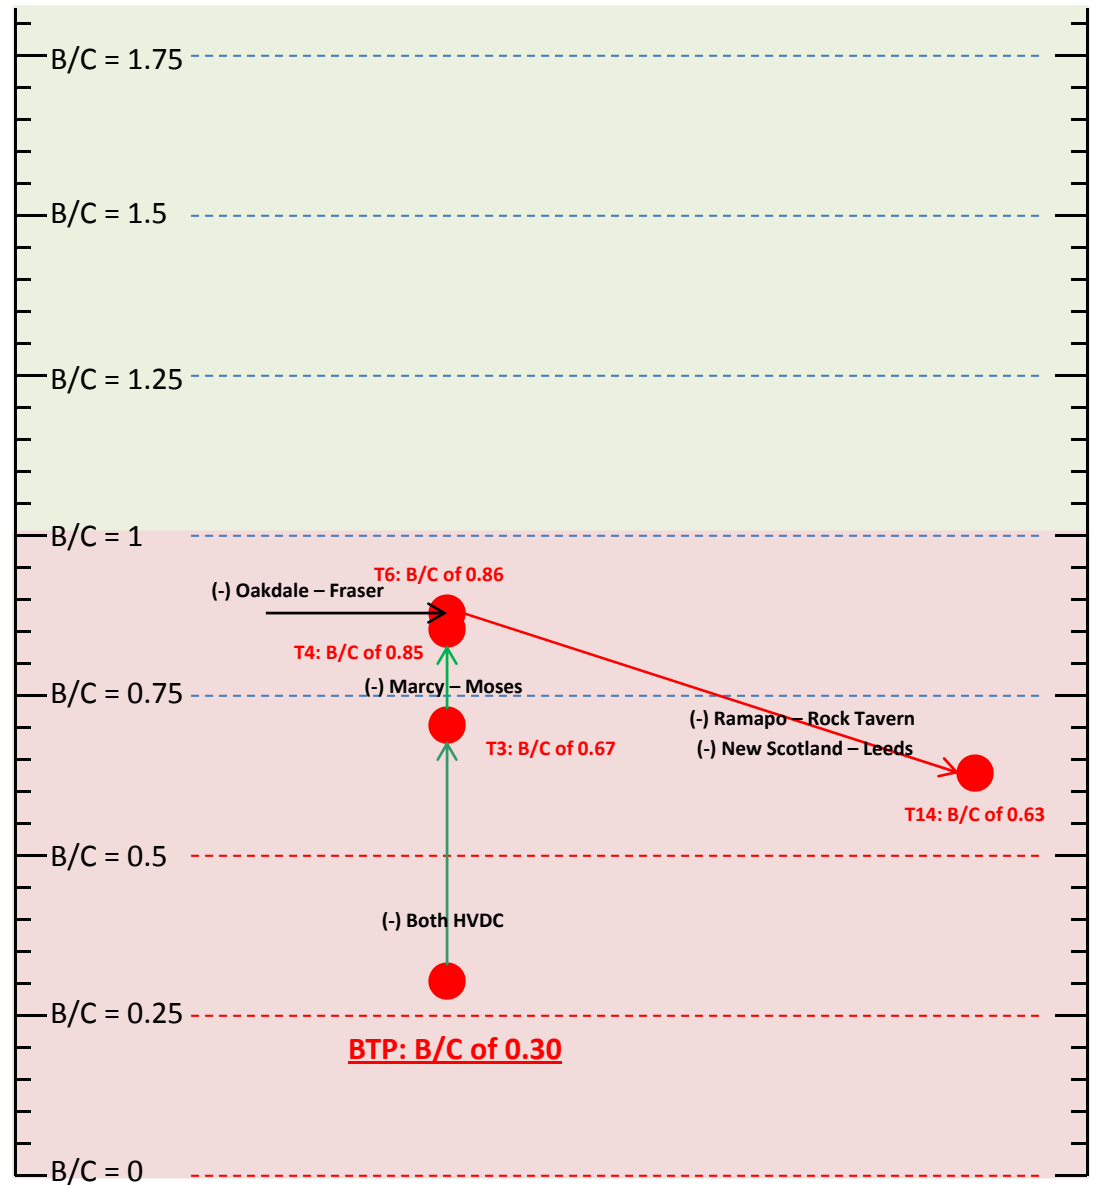

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

## STARS Base Transmission Plan Trials Results – “8,000 MW Wind” Scenario (B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

Trial	Benefit Under 8,000 MW Scenario (M\$)	Cost (M\$)	B/C Ratio (M\$)	Reference Case Benefit (M\$)	Delta Benefit Change (M\$)
Initial (BTP)	181	597	0.30	199	-18
T3	175	261	0.67	175	0
T4	181	213	0.85	176	+5
T6	146	170	0.86	144	+2
T14	74	118	0.63	87	-13

### Notes:

- The “8,000 MW Wind” scenario lowers the benefits of trials Initial (BTP) and T14; but remains essentially neutral for Trials T3, T4 and T6.
- Highlight, trial 14 trial benefits drop by 15% or 13 M\$.

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

# STARS Base Transmission Plan Trials Results – “Low Cost of Fuel Forecast” Scenario

(B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

Trial	Benefit Under Low Cost of Fuel Forecast Scenario (M\$)	Cost (M\$)	B/C Ratio (M\$)	Reference Case Benefit (M\$)	Delta Benefit Change (M\$)
Initial (BTP)	144	597	0.24	199	-55
T3	132	261	0.51	175	-43
T4	130	213	0.61	176	-46
T6	115	170	0.68	144	-29
T14	76	118	0.64	87	-11

**Notes:**

- The “Low Cost of Fuel Forecast” scenario decreases considerably the benefits of the transmission system upgrades (all trials).

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

## STARS Base Transmission Plan Trials Results – “High Cost of Fuel Forecast” Scenario (B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

Trial	Benefit Under High Cost of Fuel Forecast Scenario (M\$)	Cost (M\$)	B/C Ratio (M\$)	Reference Case Benefit (M\$)	Delta Benefit Change (M\$)
Initial (BTP)	259	597	0.43	199	+60
T3	228	261	0.87	175	+53
T4	236	213	1.11	176	+60
T6	196	170	1.15	144	+52
T14	130	118	1.10	87	+43

### Notes:

- The “High Cost of Fuel Forecast” scenario increases considerably the benefits of the transmission system upgrades (all trials).

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

# STARS Base Transmission Plan Trials Results – “Low Cost of Emissions Forecast” Scenario (B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

Trial	Benefit Under Low Cost of Emissions Forecast Scenario (M\$)	Cost (M\$)	B/C Ratio (M\$)	Reference Case Benefit (M\$)	Delta Benefit Change (M\$)
Initial (BTP)	173	597	0.29	199	-26
T3	157	261	0.60	175	-18
T4	158	213	0.74	176	-18
T6	131	170	0.77	144	-13
T14	83	118	0.70	87	-4

## Notes:

- The “Low Cost of Emission Forecast” scenario decreases the benefits of the transmission system upgrades (all trials).
- Highlight, the BTP trial benefits drop by 13% or 26 M\$.

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

# STARS Base Transmission Plan Trials Results – “High Cost of Emissions Forecast” Scenario

(B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

Trial	Benefit Under High Cost of Emissions Forecast Scenario (M\$)	Cost (M\$)	B/C Ratio (M\$)	Reference Case Benefit (M\$)	Delta Benefit Change (M\$)
Initial (BTP)	113	597	0.19	199	-86
T3	95	261	0.36	175	-80
T4	136	213	0.64	176	-40
T6	129	170	0.76	144	-15
T14	61	118	0.52	87	-26

**Notes:**

- The “High Cost of Emission Forecast” scenario decreases considerably the benefits of the transmission system upgrades (all trials).

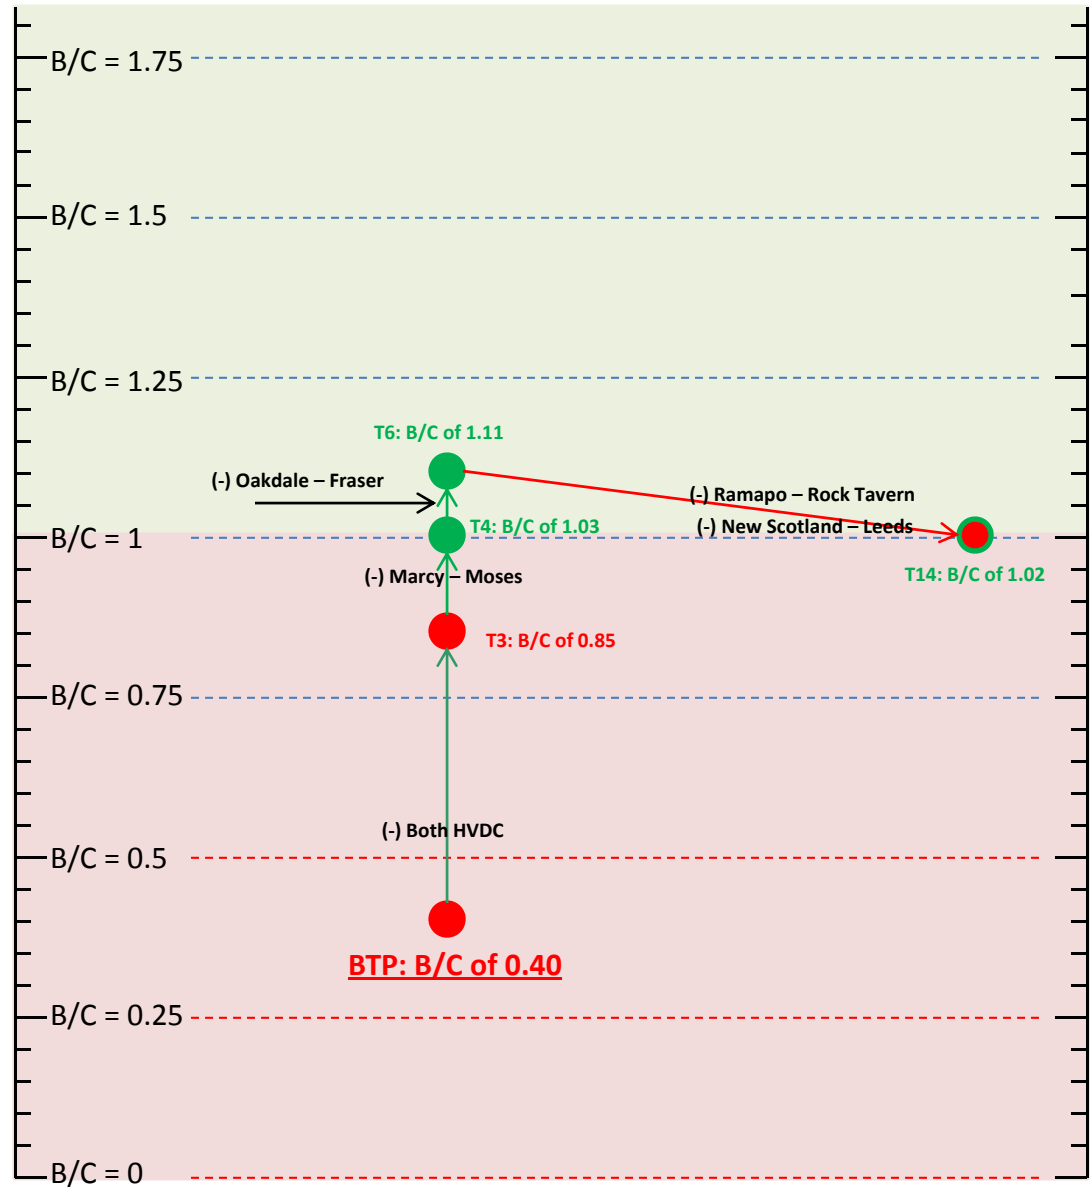

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

## STARS Base Transmission Plan Trials Results – “Shift 1,000 MW Upstate” Scenario (B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

Trial	Benefit Under Shift 1,000 MW Upstate Scenario (M\$)	Cost (M\$)	B/C Ratio (M\$)	Reference Case Benefit (M\$)	Delta Benefit Change (M\$)
Initial (BTP)	237	597	0.40	199	+38
T3	222	261	0.85	175	+47
T4	220	213	1.03	176	+44
T6	188	170	1.11	144	+44
T14	120	118	1.02	87	+33

### Notes:

- The “Shift 1,000 MW Upstate” scenario increases considerably the benefits of the transmission system upgrades (all trials).

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

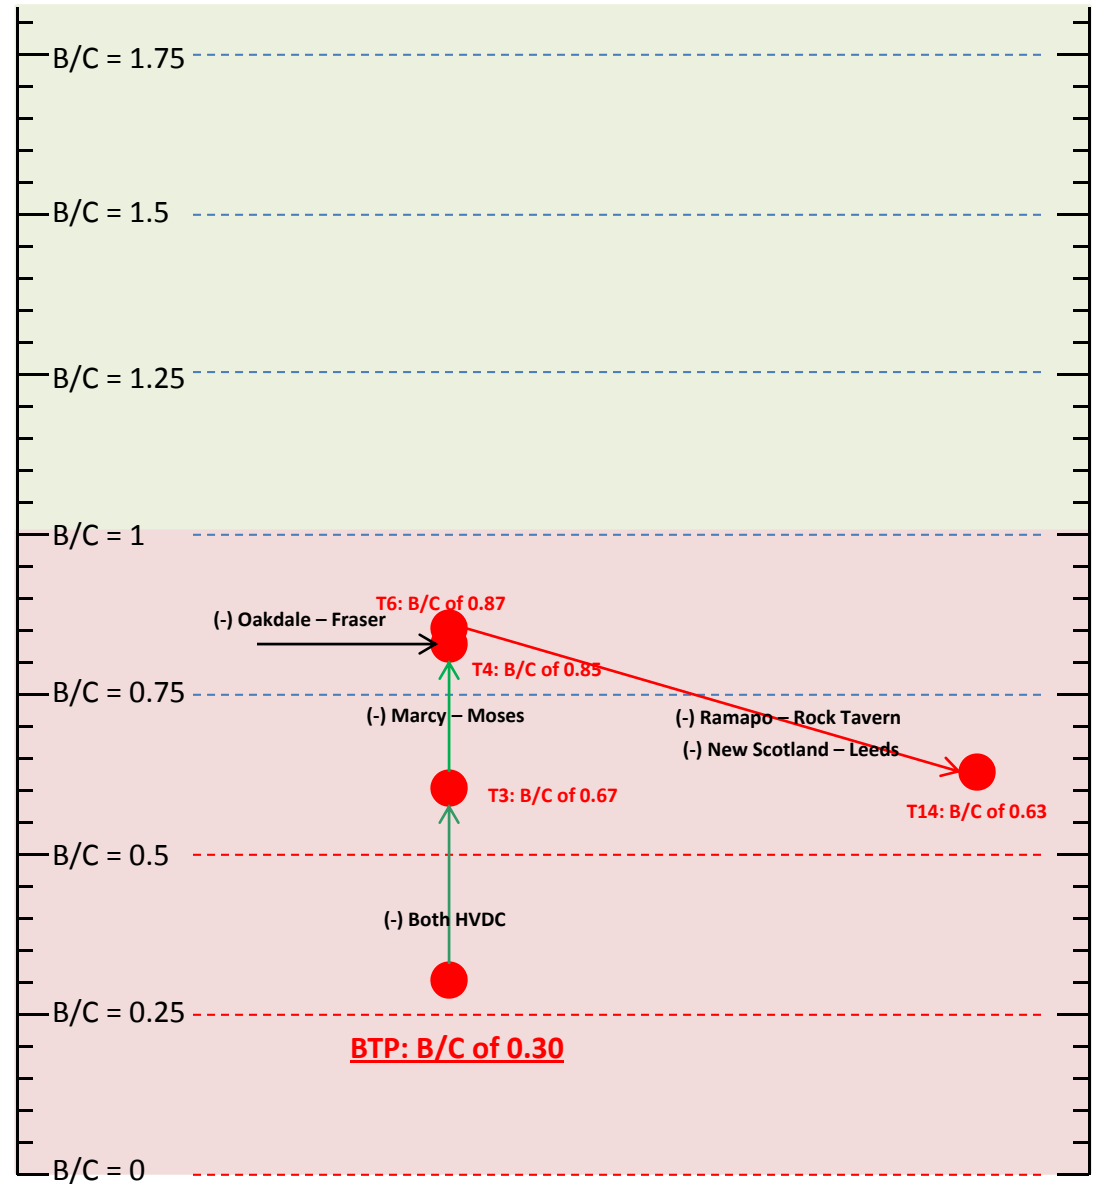

# STARS Base Transmission Plan Trials Results – “Shift 1,000 MW Downstate” Scenario

(B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

Trial	Benefit Under Shift 1,000 MW Downstate Scenario (M\$)	Cost (M\$)	B/C Ratio (M\$)	Reference Case Benefit (M\$)	Delta Benefit Change (M\$)
Initial (BTP)	173	597	0.29	199	-26
T3	160	261	0.61	175	-15
T4	163	213	0.77	176	-13
T6	129	170	0.76	144	-15
T14	74	118	0.63	87	-13

**Notes:**

- The “Shift 1,000 MW Downstate” scenario decreases the benefits of the transmission system upgrades (all trials).
- Highlight, trial 14 benefits drop by 15% or 13 M\$.

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

## STARS Base Transmission Plan Trials Results – **Scenarios: B/C Ratios (All Scenarios)** (B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

## STARS Base Transmission Plan Trials Results – Scenarios: % Change in B/C Ratio (B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

## STARS Base Transmission Plan Trials Results – Scenarios: Delta Change in B/C Ratio (B/C: Benefit to Cost Ratio – Total Production Cost Savings\* Only)

\* Total Production Cost Savings includes Production Cost Savings, Import Cost Savings, and Emissions Cost Savings

**New York State Transmission Assessment And Reliability Study (STARS)**  
STARS Phase II Scenario Results  
May 23, 2011

Background

As part of Phase II of the STARS study several future “sensitivities” will be evaluated for the established Reference Case (made up of Replacement In Kind, RIK, and Base Transmission Plan, BTP, cases). In addition to running sensitivities for the Reference Case, several iterations (“Trials”) of the BTP have been developed and each scenario will be evaluated for a few of the trials.

The sensitivities that have been developed will test a single future situation and will be used to evaluate the robustness of the Base Transmission Plan under differing circumstances. The sensitivities include:

- 1) 4,250 MW Installed Wind Capacity
- 2) 8,000 MW Installed Wind Capacity
- 3) High Fuel Price Forecasts
- 4) Low Fuel Price Forecasts
- 5) High Emissions Price Forecasts
- 6) Low Emissions Price Forecasts
- 7) Shift 1,000 MW Generic Generation Downstate
- 8) Shift 1,000 MW Generic Generation Upstate

The BTP Trials that were selected to evaluate sensitivity cases for include the Reference Case, T3, T4, T6, T9, T12, & T14. The results of the sensitivities are contained in the Results section below.

## Sensitivity Definitions & Details

In this section each of the sensitivities will be defined and described in detail.

### 1) 4,250 MW Installed Wind Capacity (Data From 2010 NYISO Wind Study)

The 4,250 MW Wind case represents a decrease in the amount of wind in the NYISO system in comparison to the Reference Case, which contains 6000 MW of installed wind capacity. All units with an “I/S” designation in the Queue column of the table below represent wind plants already in-service (1275 MW total).

<b>Units that Compose the 4250 MW Case</b>			
<b>Queue #</b>	<b>Station/Unit</b>	<b>Nameplate Rating (MW)</b>	<b>Zone</b>
I/S	Altona Windfield	99.0	D
I/S	Bliss Windfield	100.5	A
I/S	Canandaigua II	42.5	C
I/S	Canandaigua Wind Farm	82.5	C
I/S	Chateaugay Windpark	106.5	D
I/S	Clinton Windfield	100.5	D
I/S	Ellenburg Windfield	81.0	D
I/S	Fenner Wind Power	30.0	C
I/S	High Sheldon Windfarm	113.0	C
I/S	Madison Wind Power	11.6	E
I/S	Maple Ridge 1	231.0	E
I/S	Maple Ridge 2	90.7	E
I/S	Munnsville Wind Power	34.5	E
I/S	Steel Winds	20.0	A
I/S	Wethersfield 230kV	126.0	C
I/S	Wethersfield Wind Power	6.6	B
113	Prattsburgh Wind Park	55.5	C
119	Prattsburgh Wind Farm	79.5	C
152	Moresville Energy Center	129.0	E
155	Canisteo Hills Windfarm	148.5	C
156	Fairfield Wind Project	120.0	E
157	Orion Energy NY I	100	E
160	Jericho Rise Wind Farm	101.2	D
161	Marble River Wind Farm	88.2	D
166	St. Lawrence Wind Farm	130.0	E
168	Dairy Hills Wind Farm	120.0	C
169	Alabama Ledge Wind Farm	79.2	B
171	Marble River II Wind Farm	140.7	D
182	Howard Wind	62.5	C
186	Jordanville Wind	136.0	E
189	Clayton Wind	126.0	E
197	Tug Hill	78.0	E
198	New Grange Wind Farm	79.9	A
203	GenWy Wind Farm	478.5	A
207	Cape Vincent	210.0	E

<b>220</b>	Armenia Mountain I	175.0	C
<b>221</b>	Armenia Mountain II	75.0	C
<b>222</b>	Ball Hill Windpark	99	A
<b>234</b>	Steel Winds II	60	A
<b>237</b>	Allegany Windfield	79	A

2) 8,000 MW Installed Wind Capacity (Data From 2010 NYISO Wind Study)

The 8,000 MW Wind Case represents an increase of 2,000 MW of installed wind capacity to the Reference Case.

<b>Units Added to the 4250MW Case to Create the 8000 MW Case</b>			
<b>Queue #</b>	<b>Station/Unit</b>	<b>Nameplate Rating (MW)</b>	<b>Zone</b>
150	Cherry Valley Wind Power	70	F
178	Allegany Wind	79.0	A
179	Cherry Hill Windpark	102	D
187	North Slope Wind	109.5	D
215	Noble Burke Windpower	120	D
217	Cherry Flats	90	C
227	Orleans Wind	120	B
236	Dean Wind	150	C
238	Tonawanda Creek Wind	75	B
239	Western Door Wind	100	C
240	Farmersville Windpark	100	A
246	Dutch Gap Wind	250	E
254	Ripley-Westfield Wind	124.8	A
256	Niagara Shore Wind	70.5	A
263	Stony Creek Wind Farm	142.5	C
241	Chateaugay II Windpark	19.5	D
270	Hounsfield Wind	268.8	C
282	Concord Wind	101.2	A
285	Machias I	79.2	A
297	Ashford Wind	19.9	A
298	Leicester Wind	57	B
301	Hamlin Wind Farm	80	B
327	Offshore Wind	1400	J, K

The table below gives a more detailed breakdown of the wind generation present in all of the STARS cases (6000 MW wind is installed in the Reference Case):

4,250 MW Wind Case	6,000 MW Wind Case	8,000 MW Wind Case	Queue #	Station/Unit	Nameplate Rating (MW)	Zone
			I/S	Altona Windfield	99	D
			I/S	Bliss Windfield	100.5	A
			I/S	Canandaigua II	42.5	C
			I/S	Canandaigua Wind Farm	82.5	C
			I/S	Chateaugay Windpark	106.5	D
			I/S	Clinton Windfield	100.5	D
			I/S	Ellenburg Windfield	81	D
			I/S	Fenner Wind Power	30	C
			I/S	High Sheldon Windfarm	113	C
			I/S	Madison Wind Power	11.6	E
			I/S	Maple Ridge 1	231	E
			I/S	Maple Ridge 2	90.7	E
			I/S	Munnsville Wind Power	34.5	E
			I/S	Steel Winds	20	A
			I/S	Wethersfield 230kV	126	C
			I/S	Wethersfield Wind Power	6.6	B
			113	Prattsburgh Wind Park	55.5	C
			119	Prattsburgh Wind Farm	79.5	C
			152	Moresville Energy Center	129	E
			155	Canisteo Hills Windfarm	148.5	C
			156	Fairfield Wind Project	120	E
			157	Orion Energy NY I	100	E
			160	Jericho Rise Wind Farm	101.2	D
			161	Marble River Wind Farm	88.2	D
			166	St. Lawrence Wind Farm	130	E
			168	Dairy Hills Wind Farm	120	C
			169	Alabama Ledge Wind Farm	79.2	B
			171	Marble River II Wind Farm	140.7	D
			182	Howard Wind	62.5	C
			186	Jordanville Wind	136	E
			189	Clayton Wind	126	E
			197	Tug Hill	78	E
			198	New Grange Wind Farm	79.9	A
			203	GenWy Wind Farm	478.5	A
			207	Cape Vincent	210	E
			220	Armenia Mountain I	175	C
			221	Armenia Mountain II	75	C
			222	Ball Hill Windpark	99	A
			234	Steel Winds II	60	A
			237	Allegheny Windfield	79	A

<b>4,250 MW Wind Case</b>	<b>6,000 MW Wind Case</b>	<b>8,000 MW Wind Case</b>	<b>Queue #</b>	<b>Station/Unit</b>	<b>Nameplate Rating (MW)</b>	<b>Zone</b>

			301	Hamlin Wind Farm	80	B
			327	Offshore Wind	1400	J, K

### 3) High Fuel Price Forecasts

The high fuel price forecast is set to one standard deviation above the 2030 fuel forecast developed by the NYISO forecasting group. The high fuel forecasts for Coal and Uranium did not change due to the relative stability of the two fuel markets. Fuel prices are shown in \$/MMBtu.

Fuel Name	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec

#### 4) Low Fuel Price Forecasts

The low fuel price forecast is set to one standard deviation below the 2030 fuel forecast developed by the NYISO forecasting group. The low fuel forecasts for Coal and Uranium did not change due to the relative stability of the two fuel markets. Fuel prices are shown in \$/MMBtu.

<b>Fuel Name</b>	<b>Jan</b>	<b>Feb</b>	<b>Mar</b>	<b>Apr</b>	<b>May</b>	<b>Jun</b>	<b>Jul</b>	<b>Aug</b>	<b>Sep</b>	<b>Oct</b>	<b>Nov</b>	<b>Dec</b>

5) High Emissions Price Forecasts

In the High Emissions Price Forecast Case the price of CO<sub>2</sub> is set to \$100/ton and prices for SO<sub>2</sub> and NO<sub>x</sub> are 2x the values from the Reference Case. This is a similar method as to what was used in the CARIS I 2009 study to simulate a high emissions price forecast. The emissions price changes were applied to all zones and regions in the simulation.

<b>Emissions Type</b>	<b>Reference Case Emissions Cost (\$/ton)</b>	<b>High Emissions Case Emissions Cost (\$/ton)</b>
CO <sub>2</sub>	46.18	100.00
NO <sub>x</sub>	2122.00	4244.00
SO <sub>2</sub>	467.90	935.80

6) Low Emissions Price Forecasts

In the Low Emissions Price Forecast Case the price of CO<sub>2</sub>, NO<sub>x</sub>, & SO<sub>2</sub> is set to the values used in the CARIS I 2009 study. The emissions price changes were applied to all zones and regions in the simulation.

<b>Emissions Type</b>	<b>Reference Case Emissions Cost (\$/ton)</b>	<b>Low Emissions Case Emissions Cost (\$/ton)</b>
CO <sub>2</sub>	46.18	6.18
NO <sub>x</sub>	2122.00	300.30
SO <sub>2</sub>	467.90	17.16

7) Shift 1,000 MW Generic Generation Downstate

To shift generation downstate, several generators were selected in Zone C and reassigned to busses in Zones J&K. If 1000 MW of generic generation was not available in C to relocate, nearby zones were used. Details of the generation shift can be seen in the table below.

<b>Generator</b>	<b>Old Bus</b>	<b>New Bus</b>	<b>Pmax Old (MW)</b>	<b>Pmax New (MW)</b>	<b>MW Shift</b>
Gen @120101_ID_C1	Kintigh	Holbrook	187	187	187

Gen @121103_ID_C3	Holbrook*	x	187	196	9
Gen @120101_ID_C1	Kintigh*	x	187	178	0

*\*Generic generation adjusted to create an exact 1000 MW shift*

8) Shift 1,000 MW Generic Generation Upstate

To shift generation upstate, several generators were selected in Zones J&K and reassigned to busses in Zone C. Details of the generation shift can be seen in the table below.

<b>Generator</b>	<b>Old Bus</b>	<b>New Bus</b>	<b>Pmax Old (MW)</b>	<b>Pmax New (MW)</b>	<b>MW Shift</b>
Gen @121001_ID_C1	E13TH 345kV	Scriba	187	187	187

Gen @120101_ID_C1	Kintigh*	x	187	252	65
Gen @121103_ID_C3	Holbrook*	x	187	122	0

*\*Generic generation adjusted to create an exact 1000 MW shift*

Results

The results being presented in this document show the Benefit/Cost (B/C) ratios for each BTP Trial selected for each of the sensitivities defined. The table below shows the detailed results of the analysis:

*STARS Base Transmission Plan Sensitivity Analysis Results – Production Cost Savings B/C Ratios*

## 1. INTRODUCTION

This report describes the calculation of transfer limits for key interfaces in the New York State Transmission System for the Horizon Year with the Base Transmission Plan (BTP) projects. The purpose of these calculations is to establish transfer limits for use in subsequent LOLE analysis.

Emergency thermal transfer limits were calculated for sixteen major interfaces within the NYCA: Dysinger East, West Central, Volney East, Moses South, Total East, Central East, Central East + Fraser-Gilboa, Central East Group, F to G, UPNY-SENY, UPNY-ConEd, Millwood South Closed, I to J, Dunwoodie South Open, I to K and LIPA Import. In addition, emergency voltage transfer limits were calculated for the Central East, Central East + Fraser-Gilboa and CE Group interfaces.

## 2. DESCRIPTION OF POWER FLOW MODEL

A power flow model representative of Horizon Year summer peak load conditions was used in this analysis. Total New York Control Area (NYCA) demand (load + losses) is 40,816 MW. Table 2-1 summarizes NYCA load and losses in the power flow model.

**Table 2-1: Load Levels in Horizon Year Summer Peak Case**

Zone #	Zone Name	Load (MW)	Losses (MW)	Demand (MW)
1	West	2999	124	3123
2	Genessee	2274	91	2365
3	Central	3144	179	3323
4	North	947	24	971
5	Mohawk Valley	1392	208	1600
6	Capital	2675	193	2868
7	Hudson Valley	2863	85	2948
8	Millwood	734	48	782
9	Dunwoodie	1706	48	1753
10	NYC	14143	184	14327
11	Long Island	6643	114	6757
<b>Total:</b>		<b>39521</b>	<b>1295</b>	<b>40816</b>

Table 2-2 summarizes the base case interface flows in the NYCA system and between NYCA and neighboring systems. Table 2-3 summarizes the schedules for selected phase angle regulators (PARs) and other controlled devices in the base case.

The case includes the following Initial Base Transmission Plan (BTP) facilities:

1. Oakdale-Fraser 345kV line #2
2. Moses-Marcy 345kV & Moses-Edic 345kV lines
3. Marcy-Jordanville-Princetown-New Scotland 345kV line
4. New Scotland-Leeds 345kV #3
5. Leeds-Pleasant Valley 345kV line #3
6. Rock Tavern-Ramapo 345kV line #2
7. Pleasant Valley – Sprainbrook HVDC line (900MW)
8. Pleasant Valley – Ruland Road HVDC line (600MW)
9. National Grid 115kV transmission upgrades

**Table 2-2: Summary of Base Case Interface Flows**

<b>Interface</b>	<b>Flow (MW)</b>
Dysinger East	2132
West Central	878

### 3. CALCULATION OF EMERGENCY THERMAL TRANSFER LIMITS

Transfer limit analysis was performed to establish emergency thermal transfer limits for thermally-constrained interfaces. The analysis was performed on the Horizon Year power flow case presented in Section 2 of this report.

#### 3.1 Methodology

Emergency transfer limits were established using the Linear FCITC Calculation tool in the PSS<sup>TM</sup>MUST Program (version 10.2).

The emergency transfer limit is the transfer level at which:

- a branch is loaded at its normal rating (Rate A) for pre-contingency conditions, or
- a branch is loaded at its short-term emergency rating (Rate C) following a contingency

For the purposes of this analysis, transmission facilities rated 100 kV and above within NYCA (and tie-lines out of NYCA) were monitored. Engineering judgment was used to identify limiting transmission facilities. Generally, “direct tie” facilities or facilities in the vicinity of the interface being studied that became loaded at their Rate A or Rate C ratings as described above were flagged.

Interface definitions for the Volney East, Moses South, Central East, Central-East+Fraser-Gilboa, CE Group, F-to-G, UPNY-SENY, UPNY-ConEd, Total East and Millwood South Closed were updated to include the BTP transmission facilities. See Appendix A.

The following types of contingencies were simulated based on the contingency files provided by NYISO. In addition to these contingencies, other contingencies provided by National Grid associated with wind generation in the North Country were simulated.

1. Outage of branches connected between buses with a base voltage of 100 kV and above (these included outages based on “automatic” N-1 contingency specification<sup>1</sup> in MUST and specific pre-defined branch outages)
2. Generator outages
3. Series element contingencies
4. Bus contingencies

---

<sup>1</sup> Automatic N-1 contingencies were not simulated in the Con Edison system.

## 5. HVdc contingencies

Phase angle regulators maintain their scheduled power flow pre-contingency but are fixed at their corresponding pre-contingency angle post-contingency.

### 3.2 Results

Table 3-1 summarizes the emergency thermal transfer limits obtained from the MUST analysis (full MUST output for the various interfaces is provided in Appendix B). Limits are rounded down to the nearest 25 MW.

Limits for the upstate interfaces were calculated without making any adjustments to the base case. Limits for the downstate interfaces are sensitive to phase angle regulator settings in Con Edison and LIPA and were calculated as described below:

Interface limits for the UPNY-ConEd Open, Millwood South Closed, Dunwoodie South Open and I-to-J interfaces were calculated based on the following assumptions (same assumptions as in the NYISO 2010 CATR; see reference [2]):

- Sherman Creek PAR1 and PAR2 are scheduled at 200 MW each into NYC.
- Parkchester PAR1 and PAR2 are scheduled at 245 MW each into NYC.
- Dunwoodie North PAR1 and PAR2 are scheduled at 115 MW each into NYC.
- Dunwoodie South PAR1 and PAR2 are scheduled at 120 and 115 MW respectively into NYC.

Limits for the “I to K” and “Long Island Import” interfaces were computed by making the following adjustments:

- Neptune HVDC is scheduled at 600 MW into LIPA.
- Cross Sound Cable is scheduled at 330 MW into LIPA.
- Pleasant Valley – Ruland Road HVDC line is scheduled at 568 MW into LIPA<sup>2</sup>.
- Northport PARs are scheduled at 450 MW into LIPA.
- Jamaica – Lake Success PAR is adjusted at 85 MW into LIPA.
- Jamaica – Valley Stream PAR is adjusted at 90 MW into LIPA.
- EGC PAR1 and PAR2 are scheduled at 318 MW each into LIPA.
- Resulting base case flow on Y50 (Dunwoodie – Shore Road 345 kV) is 616 MW.

---

<sup>2</sup> Due to HVDC converter and cable losses, receiving end power at Ruland Road is 568 MW. Power at the sending end (Pleasant Valley) is assumed to be 600 MW.

Table 3-2 compares the horizon year transfer limits (with BTP projects) against the intermediate year transfer limits (without BTP projects) derived earlier in Phase 2 of the STARS study (see reference [1]). This is not an “apples-to-apples” comparison because the transmission system and study years are different between the two sets of results. However, the comparison provides insight into how the emergency transfer limits have changed from the intermediate year to the horizon year without and with the BTP projects respectively.

In general, the following observations are made from Table 3-2.

1. Emergency transfer limits for the Dysinger East and West Central interfaces *decreased* by 9% and 4% respectively. This may be a consequence of load growth in Zones A and B (load growth in each of these zones is approx. 9% going from the Intermediate Year to the Horizon Year).
2. The limits for the Volney East interface exhibited a 5% decrease going from the Intermediate Year to the Horizon Year. The decrease in transfer limits is because the limiting facility for this interface (Fraser – Coopers Corners 345 kV line) is pre-loaded following the addition of BTP project Oakdale-Fraser 345 kV ckt #2.
3. The Moses South interface exhibited an increase of 58% in the emergency thermal transfer limits. However this increase is not entirely attributable to the BTP line additions (the BTP plan replaces the existing Moses-Adirondack-Porter 230 kV lines with the Moses-Marcy and the Moses-Edic 345 kV lines). The increase in emergency thermal transfer limits can be explained as follows (see Moses South FCITC tables in Appendix B). The tables show that the following constraints potentially impact the Moses South transfer limit:
  - Marcy 765/345 kV transformer AT-1 for loss of AT-2: According to reference [3], the post-contingency flow on the Marcy AT-1 bank is allowed to exceed its STE rating for the loss of the Marcy AT-2 bank, provided that the overload relay protection on the AT-1 bank is in-service. Under these assumptions, this is not a valid constraint.
  - Moses 345/230 kV transformer #1 for loss of #2 (and vice versa): NYPA indicated that this is not a valid constraint because the Moses 345/230 kV transformers can be sized such that loss of one transformer does not overload the other.
  - Marcy 765/345 kV transformer AT-2 for loss of AT-1: According to the reference [3], it is understood that the loading on AT-2 is not allowed to exceed its STE. Therefore, this becomes the binding limit. The

corresponding Moses South transfer limit is 4220 MW (4200 MW when rounded down to the nearest 25 MW).

4. The Central East, Central East+Fraser-Gilboa and CE Group interfaces all exhibited an increase in emergency transfer limits due to the addition of BTP transmission facilities, in particular the Marcy-Jordanville-Princetown-New Scotland 345kV line and the transmission facilities south of New Scotland. It should be noted here that despite this increase, these interfaces are voltage limited i.e., the voltage transfer limits for these interfaces are more restrictive than the corresponding emergency thermal transfer limits. See Sections 4 and 5.
5. Emergency transfer limits for the F-to-G, UPNY-SENY, UPNY-ConEd, Total East and Millwood South Closed interfaces increased significantly following the addition of the BTP projects.
6. The emergency transfer limit for the I-to-K interface is identical to the corresponding limit derived earlier in Phase 2 of the STARS study<sup>3</sup>.
7. The definition for the LIPA Import interface was updated by including the Pleasant Valley – Ruland Road HVDC line.

---

<sup>3</sup> The limiting transfer for the I-to-K and LIPA Import interfaces is Y50 (Dunwoodie – Shore Road 345 kV). The limit is based on the MW rating for Y50 (653 MW).

## 4. CALCULATION OF EMERGENCY VOLTAGE TRANSFER LIMITS

Emergency voltage transfer limits were calculated on the Horizon Year power flow case presented in Section 2 of this report.

### 4.1 Methodology

Emergency voltage transfer limits were calculated using the PV Analysis tool of PSS/E™ (version 30).

The limits were calculated by preparing a series of power flow cases with increasing MW transfers across the interfaces being studied and subjecting them to severe (voltage-wise) contingencies. The monitored buses were then reviewed for violations of post-contingency minimum voltage criteria and/or voltage collapse.

The testing followed NYISO practices and procedures discussed in Attachment E of the NYISO Transmission Expansion and Interconnection Manual [4]. MW transfers were increased until the point of voltage collapse was reached. In power flow analysis, this point is the highest transfer level for which a solution can be achieved. There is no solution beyond this transfer level because there are no more dispatchable reactive power resources available to support the transfer. Upon plotting the specific bus voltage (y-axis) against the pre-contingency MW transfer level (x-axis), the impending voltage collapse can be identified as the knee point on the PV curve. Based on the maximum sustainable pre-contingency MW transfer (i.e. the transfer level for which a solution can be achieved post contingency; with any further increases in power transfer rendering the system un-solvable due to reactive power deficiency), a reduced pre-contingency transfer level based on a 5% safety margin is determined. This reduced transfer is then compared against the pre-contingency MW transfer level which corresponds to a post-contingency minimum voltage at the monitored buses. In order to ensure that a voltage-based transfer limit is computed with a margin of safety, the lower of the two power transfers (i.e. 95% of that corresponding to voltage collapse point or that obtained by applying the relevant post-contingency low voltage limit) is chosen as the voltage-limited interface maximum transfer level.

The following assumptions were made for the analysis:

1. Phase angle regulators (“PARs”), switched shunts and LTC transformers are modeled as regulating pre-contingency and non-regulating post-contingency.
2. SVC and FACTS devices are set to near zero pre-contingency and allowed to operate full range post-contingency.

## 4.2 Results

Table 4-1 summarizes the emergency voltage transfer limits for the Central East, Central East + Fraser-Gilboa and CE Group interfaces. For comparison purposes, corresponding intermediate year limits derived earlier in Phase 2 of the STARS study (reference [1]) are also summarized. Limits are rounded down to the nearest 25 MW. The last two columns summarize the differences between the two sets of limits both in MW and as a percentage of the intermediate year limits. The Plattsburgh-Sandbar 115 kV line is not included in the interface definitions.

Figure 4-1 shows the PV curves for the Central East interface at the Marcy 345 kV bus for pre-contingency conditions. The plot shows that when the flow on the Central East interface is 3298 MW, the Marcy 345 kV voltage violates the pre-contingency low voltage limit of 348 kV.

Figure 4-2 shows the PV curves for the Central East interface at the New Scotland 77 bus for various post-contingency conditions. For each contingency, the post-contingency voltage at New Scotland 77 bus is plotted against the pre-contingency MW flow on the interface. The most limiting contingency is the simultaneous loss of the Marcy – Coopers Corners and Fraser – Coopers Corners 345 kV lines (CE08). Note from the Figure 4-2 that for this particular contingency, the nose of the curve is approx. 3507 MW. The pre-contingency transfer that corresponds to 95% of 3507 MW is 3332 MW. The post-contingency voltage at the 3332 MW transfer level is above the post-contingency low voltage limit (328 MW). However, the pre-contingency flow of 3298 MW from Figure 4-1 is more limiting. Based on the above, the emergency voltage transfer limit for the Central East interface is 3298 MW.

Similarly, the emergency voltage transfer limits for the Central East + Fraser-Gilboa and the CE Group interfaces are 3712 MW and 5563 MW respectively.

**Table 4-1: Emergency Voltage Transfer Limits**

Interfaces	Post-Contingency Low (A)		95% Voltage Collapse (B)			Pre-Contingency Low		Horizon Year Limit with BTP Min(A,B,C)	Phase II Limit (Intermediate Year; No BTP)		Diff with Phase II Limit
	MW Flow	Limiting Facility	MW Flow	Limiting Facility	Tip of Curve	MW Flow	Limiting Bus	MW Flow	MW Flow	Limiting Facility	(%)
CENTRAL EAST	3375	1	3332	2	3507	<b>3298</b>	<b>Marcy 345</b>	3275	2925	3	12.7
CE+FRASER-GILBOA	3825	1	3805	2	4005	<b>3712</b>	<b>Marcy 345</b>	3700	3350	3	10.3
CE-GROUP	5710	1	5656	2	5953	<b>5563</b>	<b>Marcy 345</b>	5550	5175	3	7.5

Notes:

- 1) New Scotland 345kV bus voltage post-contingency low limit for L/O Coopers Corners-Marcy 345kV and Coopers Corners-Fraser 345kV (CE08)
- 2) 95% PV nose for L/O Coopers Corners-Marcy 345kV and Coopers Corners-Fraser 345kV (CE08)
- 3) 95% PV nose for L/O TWR 34/42 (CE18)

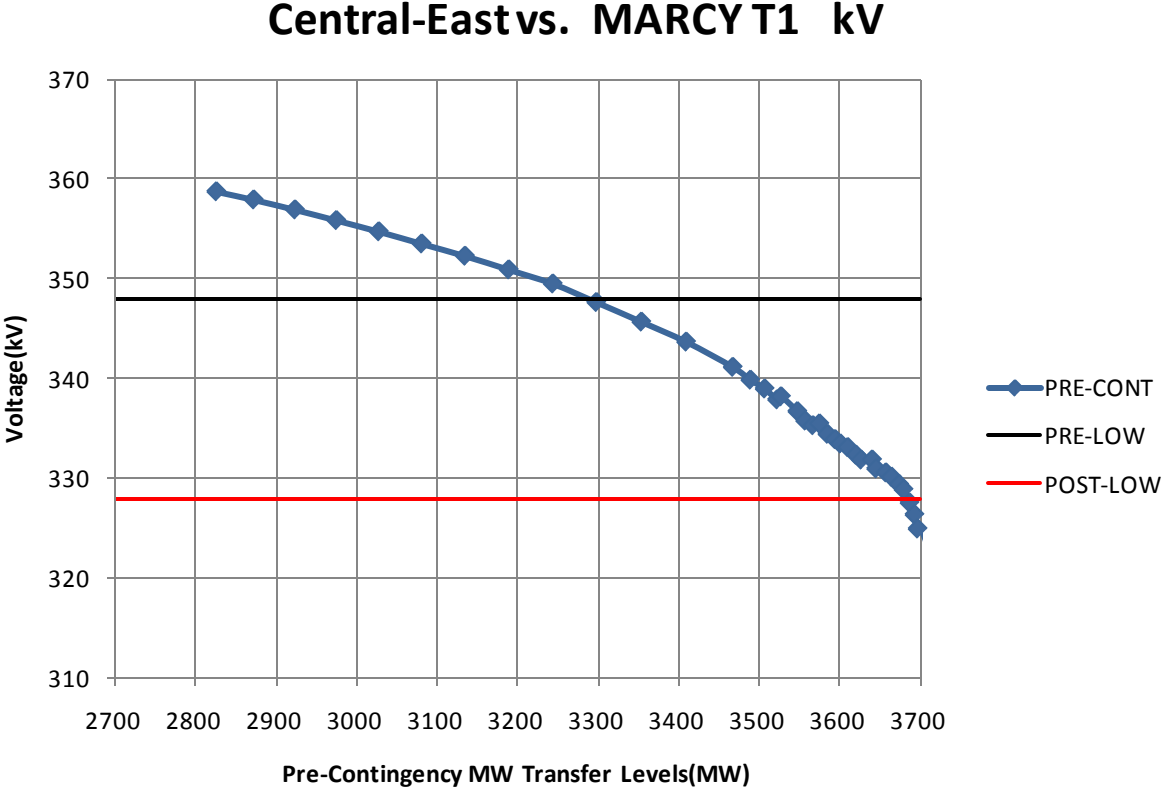

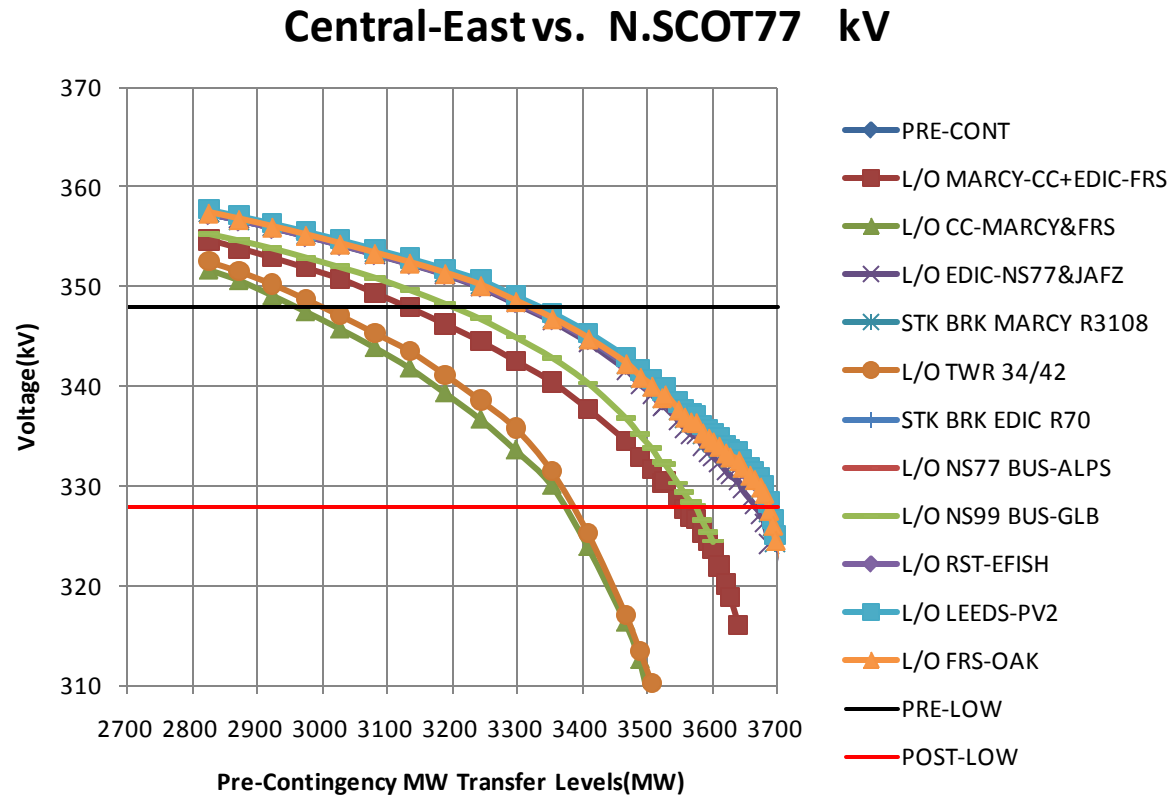

Figure 4-2: PV Curves for Central East Interface Showing Post-Contingency Voltage Limit

## 5. CONSOLIDATION OF EMERGENCY THERMAL AND VOLTAGE TRANSFER LIMITS FOR CENTRAL EAST INTERFACE

Emergency thermal and emergency voltage transfer limits for the Central East, Central East + Fraser Gilboa and CE Group interfaces are consolidated and presented in Table 5-1. The more limiting of the two transfer limits is shown in the last column.

**Table 5-1: Consolidation of Central East Limits**

Interface	STARS Horizon Year Summer Peak Case with BTP			
	Emergency Thermal Transfer Limit (MW)	Emergency Voltage Transfer Limit (MW)	Min (Thermal, Voltage)	
Central East	4175	3275	<b>3275</b>	(V)
Central East + Fraser-Gilboa	3725	3700	<b>3700</b>	(V)
CE Group	5650	5550	<b>5550</b>	(V)

(T) = Thermally-constrained

(V) = Voltage-constrained
