

Mark Younger - Out Of Merit Generation Information Proposal

GITF Meeting – 5/8/01

At the last GITF meeting we discussed that there is not sufficient information available that provides the reason about Out Of Merit (OOM) generation was dispatched. I have developed a draft list of information that should be provided by the ISO/TOs when out of merit generation is called so that there is an auditable trail for the operation. We can discuss the draft list at the next GITF meeting.

Draft information to be provided for each Out Of Merit generation call
If the OOM is required do to a transmission constraint;

- What constraint is the cause.
- Current rating of the constraint.
- Current loading of the constraint.

If OOM generation is required for load pocket reasons,

- How much load in the pocket.
- How much capacity available in the pocket.
- Transfer capability into the pocket.
- Current loading of the transfer capability into the pocket.

If the OOM generation is required for voltage control

- What bus is the cause.
- What the voltage limit is for the bus.
- What the current voltage is for the bus.
