APPENDICES

2018 Reliability Needs Assessment (RNA)

A Report by the
New York Independent
System Operator

Draft for August 8 and 22, 2018 ESPWG/TPAS

Table of Contents

List of Figures

Appendix A - 2018 Reliability Needs Assessment Glossary

Annual Transmission Reliability Assessment (ATRA): An assessment, conducted by the NYISO staff in cooperation with Market Participants, to determine the System Upgrade Facilities required for each generation and merchant transmission project included in the Applicable Reliability Standards, to interconnect to the New York State Transmission System in compliance with Applicable Reliability Standards and the NYISO Minimum Interconnection Standard. *(Source: Attachment S of OATT)*

Area Transmission Review (ATR): The NYISO, in its role as Planning Coordinator, is responsible for providing an annual report to the NPCC Compliance Committee in regard to its Area Transmission Review in accordance with the NPCC Reliability Compliance and Enforcement Program and in conformance with the NPCC Design and Operation of the Bulk Power System. *(Source: NPCC Directory #1)*

Best Technology Available (BTA): NYS DEC policy establishing performance goals for new and existing electricity generating plants for Cooling Water Intake Structures. The policy applies to plants with design intake capacity greater than 20 million gallons/day and prescribes reductions in fish mortality. The performance goals call for the use of wet, closed-cycle cooling systems at existing generating plants. *(Source: Section 316(b), Clean Water Act, United States Environmental Protection Agency)*

New York State Bulk Power Transmission Facility (BPTF): The facilities identified as the New York State Bulk Power Transmission Facilities in the annual Area Transmission Review submitted to NPCC by the ISO pursuant to NPCC requirements. *(Source: Attachment Y of OATT definitions)*

Contingencies: An actual or potential unexpected failure or outage of a system component, such as a generator, transmission line, circuit breaker, switch, or other electrical element. A contingency also may include multiple components, which are related by situations leading to simultaneous component outages. *(Source: NYSRC Reliability Rules)*

Dependable Maximum Net Capability (DMNC): The sustained maximum net output of a Generator, as demonstrated by the performance of a test or through actual operation, averaged over a continuous time period as defined in the ISO Procedures. *(Source: OATT Definitions)*

Electric System Planning Work Group (ESPWG): The Electric System Planning Work Group, or any successor work group or committee designated to fulfill the functions assigned to the ESPWG in this tariff. *(Source: Attachment S of OATT)*

Emergency Transfer Criteria: It is intended that the NYS Bulk Power System be operated within Normal Transfer Criteria at all times insofar as possible. However, in the event that adequate facilities are not available to supply firm load within Normal Transfer Criteria, emergency transfer criteria may be invoked. Under emergency transfer criteria, transfers may be increased up to, but not exceed, emergency ratings and limits as follows:

a. Pre-contingency line and equipment loadings may be operated up to LTE ratings for up to four (4) hours, provided the STE ratings are set appropriately. Otherwise, pre-contingency line and equipment loadings must be within normal ratings. Pre-contingency voltages and transmission interface flows must be within applicable pre-contingency voltage and stability limits.

b. Post-contingency line and equipment loadings within STE ratings. Post-contingency voltages and transmission interface flows within applicable post-contingency voltage and stability limits. *(Source: NYSRC Reliability Rules)*

Fault: An electrical short circuit. *(Source: NYSRC Reliability Rules)*

Federal Energy Regulatory Commission (FERC): The federal energy regulatory agency within the U.S. Department of Energy that approves the NYISO's tariffs and regulates its operation of the bulk electricity grid, wholesale power markets, and planning and interconnection processes.

FERC Form 715: Annual report that is required by transmitting utilities operating grid facilities that are rated at or above 100 kV. The report consists of transmission systems maps, a detailed description of transmission planning

Reliability Criteria, detailed descriptions of transmission planning assessment practices, and detailed evaluation of anticipated system performance as measured against Reliability Criteria.

Forced Outage: An unscheduled inability of a Market Participant's Generator to produce Energy that does not meet the notification criteria to be classified as a scheduled outage or de-rate as established in ISO Procedures. If the Forced Outage of a Generator starts on or after May 1, 2015, the Forced Outage will expire at the end of the month which contains the 180th day of its Forced Outage but may be extended if the Market Participant has Commenced Repair of its Generator. *(Source: Market Services Tariff-MST-Definitions)*

Gold Book: Annual NYISO publication of its Load and Capacity Data Report.

Installed Capacity (ICAP): Capacity of a facility accessible to the NYS Bulk Power System, that is capable of supplying and/or reducing the demand for energy in the NYCA for the purpose of ensuring that sufficient energy and capacity is available to meet the reliability rules. *(Source: NYSRC Reliability Rules)*

Installed Capacity Requirement (ICR): The annual statewide requirement established by the NYSRC in order to ensure resource adequacy in the NYCA. *(Source: NYSRC Reliability Rules)*

Installed Reserve Margin (IRM): The amount of installed electric generation capacity above 100% of the forecasted peak electric demand that is required to meet NYSRC resource adequacy criteria. Most studies in recent years have indicated a need for a 15-20% reserve margin for adequate reliability in New York.

Local Transmission Plan (LTP): The Local Transmission Owner Plan, developed by each Transmission Owner, which describes its respective plans that may be under consideration or finalized for its own Transmission District. *(Source: Attachment Y of OATT)*

Local Transmission Planning Process (LTPP): The Local Planning Process conducted by each Transmission Owner for its own Transmission District. *(Source: Attachment Y of OATT)*

Loss of Load Expectation (LOLE): The probability (or risk) of disconnecting any firm load due to resource deficiencies shall be, on average, not more than once in ten years. Compliance with this criterion shall be evaluated probabilistically, such that the loss of load expectation (LOLE) of disconnecting firm load due to resource deficiencies shall be, on average, no more than 0.1 day per year. This evaluation shall make due allowance for demand uncertainty, scheduled outages and deratings, forced outages and deratings, assistance over interconnections with neighboring control areas, NYS Transmission System emergency transfer capability, and capacity and/or load relief from available operating procedures. *(Source: NYSRC Reliability Rules)*

Market Monitoring Unit: "Market Monitoring Unit" shall mean the consulting or other professional services firm, or other similar entity, retained by the Board, as specified in Section 30.4.2 of Attachment O, that is responsible for carrying out the Core Market Monitoring Functions and the other functions that are assigned to it in Attachment O. The Market Monitoring Unit shall recommend Tariff and market rule changes, but shall not participate in the administration of the ISO's Tariffs, except as specifically authorized in Attachment O. *(Source: Attachment O of MST)*

Market Participant: An entity, excluding the ISO, that produces, transmits, sells, and/or purchase for resale Unforced Capacity, Energy or Ancillary Services in the Wholesale Market. Market Participants include: Transmission Customers under the ISO OATT, Customers under the ISO Services Tariff, Power Exchanges, Transmission Owners, Primary Holders, LSEs, Suppliers and their designated agents. Market Participants also include entities buying or selling TCCs. *(Source: MST Definitions)*

New York Control Area (NYCA): The Control Area that is under the control of the ISO which includes transmission facilities listed in the ISO/TO Agreement Appendices A-1 and A-2, as amended from time-to-time, and Generation located outside the NYS Power System that is subject to protocols (e.g., telemetry signal biasing) which allow the ISO and other Control Area operator(s) to treat some or all of that Generation as though it were part of the NYS Power System.

(Source: OATT Definitions)

New York State Department of Environmental Conservation (NYSDEC): The agency that implements New York State environmental conservation law, with some programs also governed by federal law.

New York Independent System Operator (NYISO): Formed in 1997 and commencing operations in 1999, the NYISO is a not-for-profit organization that manages New York's bulk electricity grid – an 11,056-mile network of high voltage lines that carry electricity throughout the state. The NYISO also oversees the state's wholesale electricity markets. The organization is governed by an independent Board of Directors and a governance structure made up of committees with Market Participants and stakeholders as members.

New York State Department of Public Service (NYDPS): As defined in the New York Public Service Law, it serves as the staff for the New York State Public Service Commission.

New York State Energy Research and Development Authority (NYSERDA): A corporation created under the New York State Public Authorities law and funded by the System Benefits Charge (SBC) and other sources. Among other responsibilities, NYSERDA is charged with conducting a multifaceted energy and environmental research and development program to meet New York State's diverse economic needs, and administering state System Benefits Charge, Renewable Portfolio Standard, energy efficiency programs, the Clean Energy Fund, and the NY-Sun Initiative.

New York State Public Service Commission (NYPSC): The New York State Public Service Commission is the decision making body of the New York State Department of Public Service. The PSC regulates the state's electric, gas, steam, telecommunications, and water utilities and oversees the cable industry. The Commission has the responsibility for setting rates and ensuring that safe and adequate service is provided by New York's utilities. In addition, the Commission exercises jurisdiction over the siting of major gas and electric transmission facilities.

NY-Sun Initiative: A program initiated by Governor Cuomo in 2012 and administered by NYSERDA for the purpose of obtaining more than 3,000 MW-DC of behind-the-meter solar PV by the end of 2023.

New York State Reliability Council (NYSRC): An organization established by agreement among the Member Systems of the New York Power Pool (the "NYSRC Agreement"). *(Source: OATT Definitions)*

Normal Transfer Criteria*:* Under normal transfer criteria, adequate facilities are available to supply firm load with the bulk power transmission system within applicable normal ratings and limits as follows:

a. Pre-contingency line and equipment loadings within normal *rating*s. Pre-contingency voltages and transmission *interface* flows within applicable pre-contingency voltage and *stability limit*s.

b. Post-contingency line and equipment loadings within applicable *emergency* (LTE or STE) *rating*s. Post-contingency voltages and transmission *interface* flows within applicable post-contingency voltage and *stability limit*s.

All contingencies listed in Table B2 "NYSRC Planning Design Criteria: Contingency Event, "in the reliability rules apply under normal transfer criteria. *(Source: NYSRC Reliability Rules)*

Normal Transfer Limit: The maximum allowable transfer is calculated based on thermal, voltage, and stability testing, considering contingencies, ratings, and limits specified for normal conditions. The normal transfer limit is the lowest limit based on the most restrictive of these three maximum allowable transfers. *(Source: NYSRC Reliability Rules)*

North American Electric Reliability Corporation (NERC): The North American Electric Reliability Council or, as applicable, the North American Electric Reliability Corporation. *(Source: OATT Definitions)*

Northeast Power Coordinating Council (NPCC): The Northeast Power Coordinating Council, or any successor organization. *(Source: Attachment Y of OATT)*

Open Access Transmission Tariff (OATT): Document of Rates, Terms and Conditions, regulated by the FERC, under which the NYISO provides transmission service. The OATT is a dynamic document to which revisions are made on a collaborative basis by the NYISO, New York's Electricity

Market Stakeholders, and the FERC.

Order 890: Adopted by FERC in February 2007, Order 890 is a change to FERC's 1996 transmission open access regulations (established in Orders 888 and 889). Order 890 is intended to provide for more effective competition, transparency and planning in wholesale electricity markets and transmission grid operations, as well as to strengthen the Open Access Transmission Tariff (OATT) with regard to non-discriminatory transmission service. Order 890 requires Transmission Providers – including the NYISO – to have a formal planning process that provides for a coordinated transmission planning process, including reliability and economic planning studies.

Order 1000: The Final Rule entitled Transmission Planning and Cost Allocation by Transmission Owning and Operating Public Utilities, issued by the Commission on July 21, 2011, in Docket RM10-23-001, as modified on rehearing, or upon appeal. (See FERC Stats & Regs. ¶ 31,323 (2011) ("Order No. 1000"), on reh'g and clarification, 139 FERC ¶ 61,132 ("Order No. 1000-A"), on reh'g and clarification, 141 FERC ¶ 61,044 (2012) ("Order No. 1000- B"). *(Source: Attachment Y of OATT)*

Outage: The forced or scheduled removal of generating capacity or a transmission line from service.

Peak Demand: The maximum instantaneous power demand, measured in megawatts (MW), and also known as peak load, is usually measured and averaged over an hourly interval.

Queue Position: Queue position shall mean the order of a valid Interconnection Request, relative to all other pending valid Interconnection Requests, that is established based upon the date and time of receipt of the valid Interconnection Request by NYISO. *(Source: Attachment X of OATT)*

Rating: The operational limits of an electric system, facility, or element under a set of specified conditions.

i. *Normal Rating*: The capacity rating of a transmission facility that may be carried through consecutive twenty- four (24) hour load cycles.

ii. *Long Time Emergency (LTE) Rating:* The capacity rating of a transmission facility that can be carried through infrequent, non- consecutive four (4) hour periods.

iii. *Short Time Emergency (STE) Rating*: The capacity rating of a transmission facility that may be carried during very infrequent contingencies of fifteen (15) minutes or less duration. *(Source: NYSRC Reliability Rules)*

Reasonably Available Control Technology for Oxides of Nitrogen (NOx RACT): Regulations promulgated by NYSDEC for the control of emissions of nitrogen oxides (NOx) from fossil fuel-fired power plants. The regulations establish presumptive emission limits for each type of fossil fueled generator and fuel used as an electric generator in NY. The NOx RACT limits are part of the State Implementation Plan for achieving compliance with the National Ambient Air Quality Standard (NAAQS) for ozone. *(Source: 6 NYCRR Part 277-2)*

Reactive Power Resources: Facilities such as generators, high voltage transmission lines, synchronous condensers, capacitor banks, and static VAr compensators that provide reactive power. Reactive power is the portion of electric power that establishes and sustains the electric and magnetic fields of alternating-current equipment. Reactive power is usually expressed as kilovolt-amperes reactive (kVAr) or megavolt-ampere reactive (MVAr).

Regional Greenhouse Gas Initiative (RGGI): A cooperative effort by nine Northeast and Mid-Atlantic states (not including New Jersey or Pennsylvania) to limit greenhouse gas emissions using a market-based cap-and-trade approach. *(Source: https://www.rggi.org/)*

Reliability: The degree of performance of the bulk electric system that results in electricity being delivered to customers within accepted standards and in the amount desired. Reliability may be measured by the frequency, duration, and magnitude of adverse effects on the electric supply. Electric system reliability can be addressed by considering two basic and functional aspects of the electric system – adequacy and security.

i. *Adequacy:* The ability of the electric systems to supply the aggregate electrical demand and energy requirements of their customers at all times, taking into account scheduled and reasonably expected unscheduled outages of system elements. Note: Adequacy encompasses both generation and transmission.

ii. *Security:* The ability of the electric system to withstand disturbances such as electric short circuits or unanticipated loss of system elements. The ability of the power system to withstand the loss of one or more elements without involuntarily disconnecting firm load. *(Source: NYSRC Reliability Rules)*

Reliability Criteria: The electric power system planning and operating policies, standards, criteria, guidelines, procedures, and rules promulgated by the North American Electric Reliability Corporation (NERC), Northeast Power Coordinating Council (NPCC), and the New York State Reliability Council (NYSRC), as they may be amended from time to time. *(Source: Attachment Y of OATT definition)*

Reliability Need: A condition identified by the NYISO in the RNA as a violation or potential violation of Reliability Criteria. *(Source: Attachment Y of OATT definition)*

Reliability Needs Assessment (RNA): The Reliability Needs Assessment as approved by the ISO Board under this Attachment. *(Source: Attachment Y of OATT definition)*

Reliability Planning Process (RPP): The biennial process that includes evaluation of resource adequacy and transmission system security of the state's bulk electricity grid over a 10-year period and evaluates solutions to meet those needs. The RPP consists of two studies: the RNA, which identifies potential problems, and the CRP, which evaluates specific solutions to those problems. *(Source: Attachment Y of OATT)*

Reliability Solutions:

i. *Alternative Regulated Solutions (ARS)*: Regulated solutions submitted by a TO or other developer in response to a solicitation for solutions to a Reliability Need identified in an RNA.

ii. *Gap Solution:* A solution to a Reliability Need that is designed to be temporary and to strive to be compatible with permanent market-based proposals. A permanent regulated solution, if appropriate, may proceed in parallel with a Gap Solution. Note: The NYISO may call for a Gap Solution to an imminent threat to reliability of the Bulk Power Transmission Facilities if no market-based solutions, regulated backstop solutions, or alternative regulated solutions can meet the Reliability Needs in a timely manner.

iii. *Market-Based Solutions:* Investor-proposed projects that are driven by market needs to meet future reliability requirements of the bulk electricity grid as outlined in the RNA. Those solutions can include generation, transmission and demand response Programs.

iv. *Regulated Backstop Solutions*: Proposals required of certain TOs to meet Reliability Needs as outlined in the RNA. Those solutions can include generation, transmission or demand response. Non-Transmission Owner developers may also submit regulated solutions. *(Source: Attachment Y of OATT)*

Responsible Transmission Owner (Responsible TO): The Transmission Owner or Transmission Owners designated by the ISO, pursuant to Section 31.2.4.3, to prepare a proposal for a regulated backstop solution to a Reliability Need or to proceed with a regulated solution to a Reliability Need. The Responsible Transmission Owner will normally be the Transmission Owner in whose Transmission District the ISO identifies a Reliability Need and/or that owns a transmission facility on which a Reliability Need arises. *(Source: Attachment Y of OATT definitions)*

Special Case Resources (SCR): Demand Side Resources whose Load is capable of being interrupted upon demand at the direction of the ISO, and/or Demand Side Resources that have a Local Generator, which is not visible to the ISO's Market Information System and is rated 100 kW or higher, that can be operated to reduce Load from the NYS Transmission System or the distribution system at the direction of the ISO. Special Case Resources are subject to special rules, set forth in Section 5.12.11.1 of this ISO Services Tariff and related ISO Procedures, in order to facilitate their participation in the Installed Capacity market as Installed Capacity Suppliers. *(Source: Section 2.19 of Market Services Tariff: Special Case Resource ("SCR"))*

Study Period: The 10-year time period evaluated in the RNA and CRP. Note: Study Year 1 is the year after the RPP cycle starts and projecting forward 10 years. For example, the 2018 RNA covers the 10-year Study Period of 2019 through

2028. *(Source: Attachment Y of OATT definitions).*

System Benefits Charge (SBC): An amount of money, charged to ratepayers on their electric bills, which is administered and allocated by NYSERDA towards energy-efficiency programs, research and development initiatives, low-income energy programs, and environmental disclosure activities.

Transfer Capability: The measure of the ability of interconnected electrical systems to reliably move or transfer power from one area to another over all transmission facilities (or paths) between those areas under specified system conditions.

Transmission Constraints: Limitations on the ability of a transmission system to transfer electricity during normal or emergency system conditions.

Transmission Owner (TO): A public utility or authority that owns transmission facilities and provides Transmission Service under the NYISO's tariffs

Transmission Planning Advisory Subcommittee (TPAS): The Transmission Planning Advisory Subcommittee, or any successor work group or committee designated to fulfill the functions assigned to TPAS pursuant to this Attachment. *(Source: Attachment Y of OATT)*

Unforced Capacity Deliverability Rights (UDR): Unforced Capacity Deliverability Rights ("UDRs") are rights, as measured in MWs, associated with (i) new incremental controllable transmission projects, and (ii) new projects to increase the capability of existing controllable transmission projects that have UDRs, that provide a transmission interface to a Locality. When combined with Unforced Capacity which is located in an External Control Area or non-constrained NYCA region either by contract or ownership, and which is deliverable to the NYCA interface in the Locality in which the UDR transmission facility is electrically located, UDRs allow such Unforced Capacity to be treated as if it were located in the Locality, thereby contributing to an LSE's Locational Minimum Installed Capacity Requirement. To the extent the NYCA interface is with an External Control Area the Unforced Capacity associated with UDRs must be deliverable to the Interconnection Point. *(Source: MST Definitions)*

Weather Normalized: Adjustments made to normalize the impact of weather when making energy and peak demand forecasts. Using historical weather data, energy analysts can account for the influence of extreme weather conditions and adjust actual energy use and peak demand to estimate what would have happened if the hottest day or the coldest day had been the typical, or "normal," weather conditions. "Normal" is usually calculated by taking the average of the previous 20 years of weather data.

Zone: One of the eleven regions in the NYCA connected to each other by identified transmission interfaces and designated as Load Zones A-K.

Appendix B - The Reliability Planning Process

This appendix presents an overview of the NYISO's reliability planning process (RPP). A detailed discussion of the RPP, including applicable Reliability Criteria, is contained in NYISO Manual titled "Reliability Planning Process Manual 26," which is posted on the NYISO's website.

The NYISO RPP is an integral part of the NYISO's overall Comprehensive System Planning Process (CSPP). The CSPP is comprised of four components:

- Local Transmission Planning Process (LTPP),
- Reliability Planning Process (RPP),
- Congestion Assessment and Resource Integration Study (CARIS), and
- Public Policy Transmission Planning Process.

As part of the LTPP, local Transmission Owners perform transmission security studies for their BPTFs in their transmission areas according to all applicable criteria. Links to the Transmission Owner's LTPs can be found on the NYISO's website. The LTPP provides inputs for the RPP.

During the RPP, the NYISO conducts the Reliability Needs Assessment (RNA) and Comprehensive Reliability Plan (CRP). The RNA evaluates the adequacy and security of the bulk power system over a ten-year study period. In identifying resource adequacy needs, the NYISO identifies the amount of resources in megawatts (known as "compensatory megawatts") and the locations in which they are needed to meet those needs. After the RNA is complete, the NYISO requests and evaluates market-based solutions, regulated backstop solutions, and alternative regulated solutions that address the identified Reliability Needs. This step results in the development of the CRP for the ten-year study period.

The RPP is a long-range assessment of both resource adequacy and transmission reliability of the New York bulk power system conducted over a ten-year planning horizon. There are two different aspects to analyzing the bulk power system's reliability in the RNA: adequacy and security. Adequacy is a planning and probabilistic concept. A system is adequate if the probability of having sufficient transmission and generation to meet expected demand is equal to or less than the system's standard, which is expressed as a loss of load expectation (LOLE). The New York State bulk power system is planned to meet an LOLE that, at any given point in time, is less than or equal to an involuntary load disconnection that is not more frequent than once in every 10 years, or 0.1 days per year. This requirement forms the basis of New York's installed reserve margin (IRM) resource adequacy requirement.

Transmission Security is an operating and deterministic concept. N-1 events are evaluated to assess their impact on the system, as viewed from the normal (or 'N') system condition. N-1-0 and N-1-1 analysis evaluates the ability of the system to meet design criteria after a critical element has already been lost. An N-1or N-1-1 violation occurs when the power flowing through a transmission element exceeds its applicable rating (thermal violation) or the voltage at a bus exceeds its specified range (voltage violation).

The RPP is anchored in the market-based philosophy of the NYISO and its Market Participants, which posits that market solutions should be the preferred choice to meet the identified Reliability Needs reported in the RNA. In the CRP, the reliability of the bulk power system is assessed and solutions to Reliability Needs evaluated in accordance with existing Reliability Criteria of the North American Electric Reliability Corporation (NERC), the Northeast Power Coordinating Council, Inc. (NPCC), and the New York State Reliability Council (NYSRC) as they may change from time to time. These criteria and a description of the nature of long-term bulk power system planning are described in detail in the applicable planning manual, and are briefly summarized below. In the event that market-based solutions do not materialize to meet a Reliability Need in a timely manner, the NYISO designates the Responsible TO or Responsible TOs or developer of an alternative regulated solution to proceed with a regulated solution in order to maintain system reliability. The NYISO may provide regulated cost recovery for transmission solutions constructed to meet a Reliability Need. Under the RPP, the NYISO also has an affirmative obligation to report historic congestion across the transmission system. In addition, the draft RNA is provided to the Market Monitoring Unit for review and consideration of whether market rules changes are necessary to address an identified failure, if any, in one of the NYISO's competitive markets. If market failure is identified as the reason for the lack of market-based solutions, the NYISO will explore appropriate changes in its market rules with its stakeholders and Independent Market Monitor. The RPP does not substitute for the planning that each TO conducts to maintain the reliability of its own bulk and non-bulk power systems.

The NYISO does not license or construct projects to respond to identified Reliability Needs reported in the RNA. The ultimate approval of those projects lies with regulatory agencies such as the FERC, the NYPSC/NYDPS, environmental permitting agencies, and local governments. The NYISO monitors the progress and continued viability of proposed market and regulated projects to meet identified needs, and reports its findings in annual plans.

The CRP also provides inputs for the NYISO's economic planning process known as CARIS. CARIS Phase 1 examines congestion on the New York bulk power system and the costs and benefits of alternatives to alleviate that congestion. During CARIS Phase 2, the NYISO evaluates specific transmission project proposals for regulated cost recovery.

In the event that there is a potential loss of resources due to a proposed generator retirement or mothballing, the NYISO will administer its Generator Deactivation Process (GDP) for Generator

Deactivation Notices that it receives. If necessary, the NYISO will seek solutions to address any Generator Deactivation Reliability Needs identified through that process. The NYISO may enter into Reliability Must Run (RMR) contracts with generators with rate recovery under its tariffs, until a permanent solution is completed. In addition, the NYISO may request solutions outside of its normal planning cycle if there appears to be an imminent threat to the reliability of the Bulk Power Transmission System arising from causes other than deactivating generation.

Another component of the CSPP is the Public Policy Transmission Planning Process. Under this component, interested entities propose, and the NYPSC identify, transmission needs driven by Public Policy Requirements. The NYISO then requests that interested entities submit proposed solutions to the Public Policy Transmission Need(s) identified by the NYPSC. The NYISO evaluates the viability and sufficiency of the proposed solutions to satisfy the identified Public Policy Transmission Need. Upon a confirmation by the NYPSC that a need for a transmission solution still exists, the NYISO then evaluates and may select the more efficient or cost-effective transmission solution to the identified need. The NYISO develops the Public Policy Transmission Planning Report containing its findings regarding the proposed solutions. This report is reviewed by NYISO stakeholders and approved by the Board of Directors.

In concert with these four components, interregional planning is conducted with NYISO's neighboring control areas in the United States and Canada under the Northeastern ISO/RTO Planning Coordination Protocol. The NYISO participates in interregional planning and may consider Interregional Transmission Projects in its regional planning processes.

Figure 1 summarizes the CSPP and Figure 2 summarizes the RPP process.

Figure 1: NYISO's Comprehensive System Planning Process (CSPP)

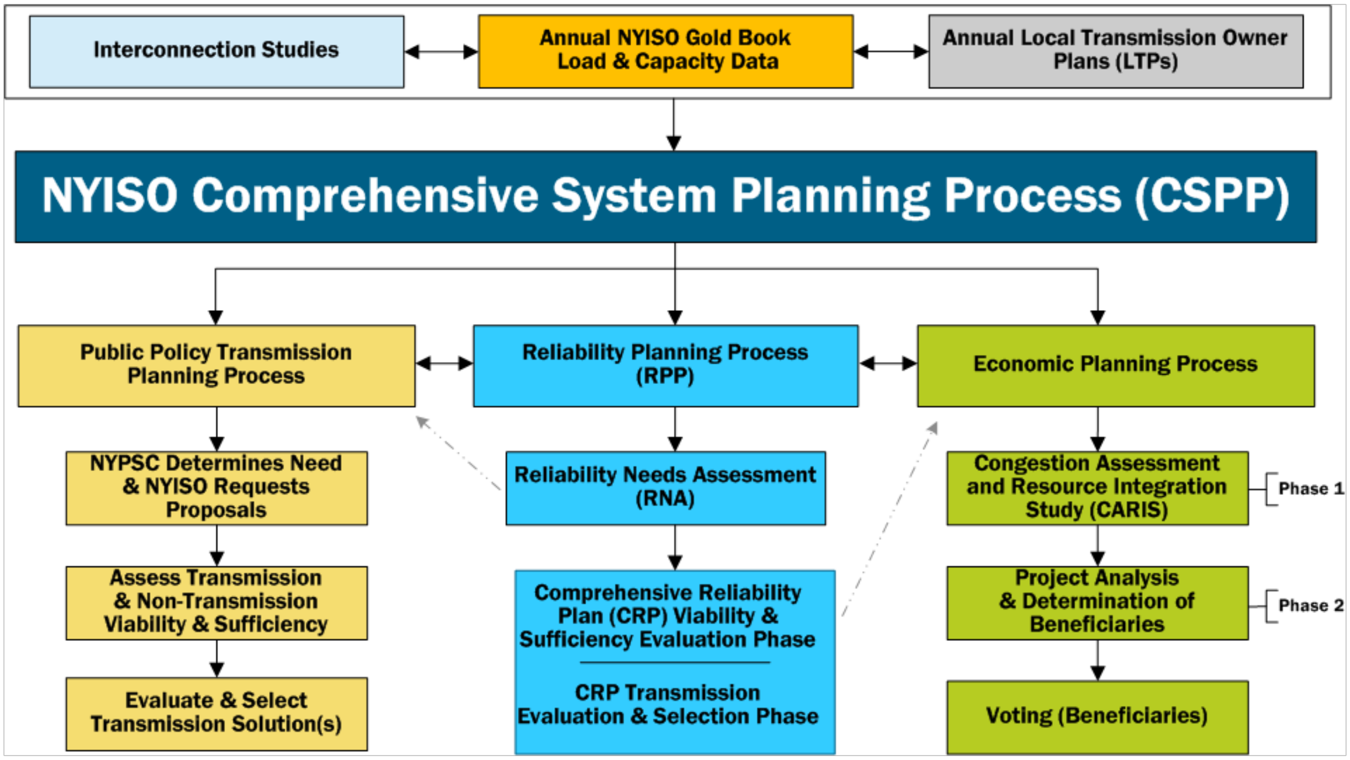

Figure 2: NYISO RPP

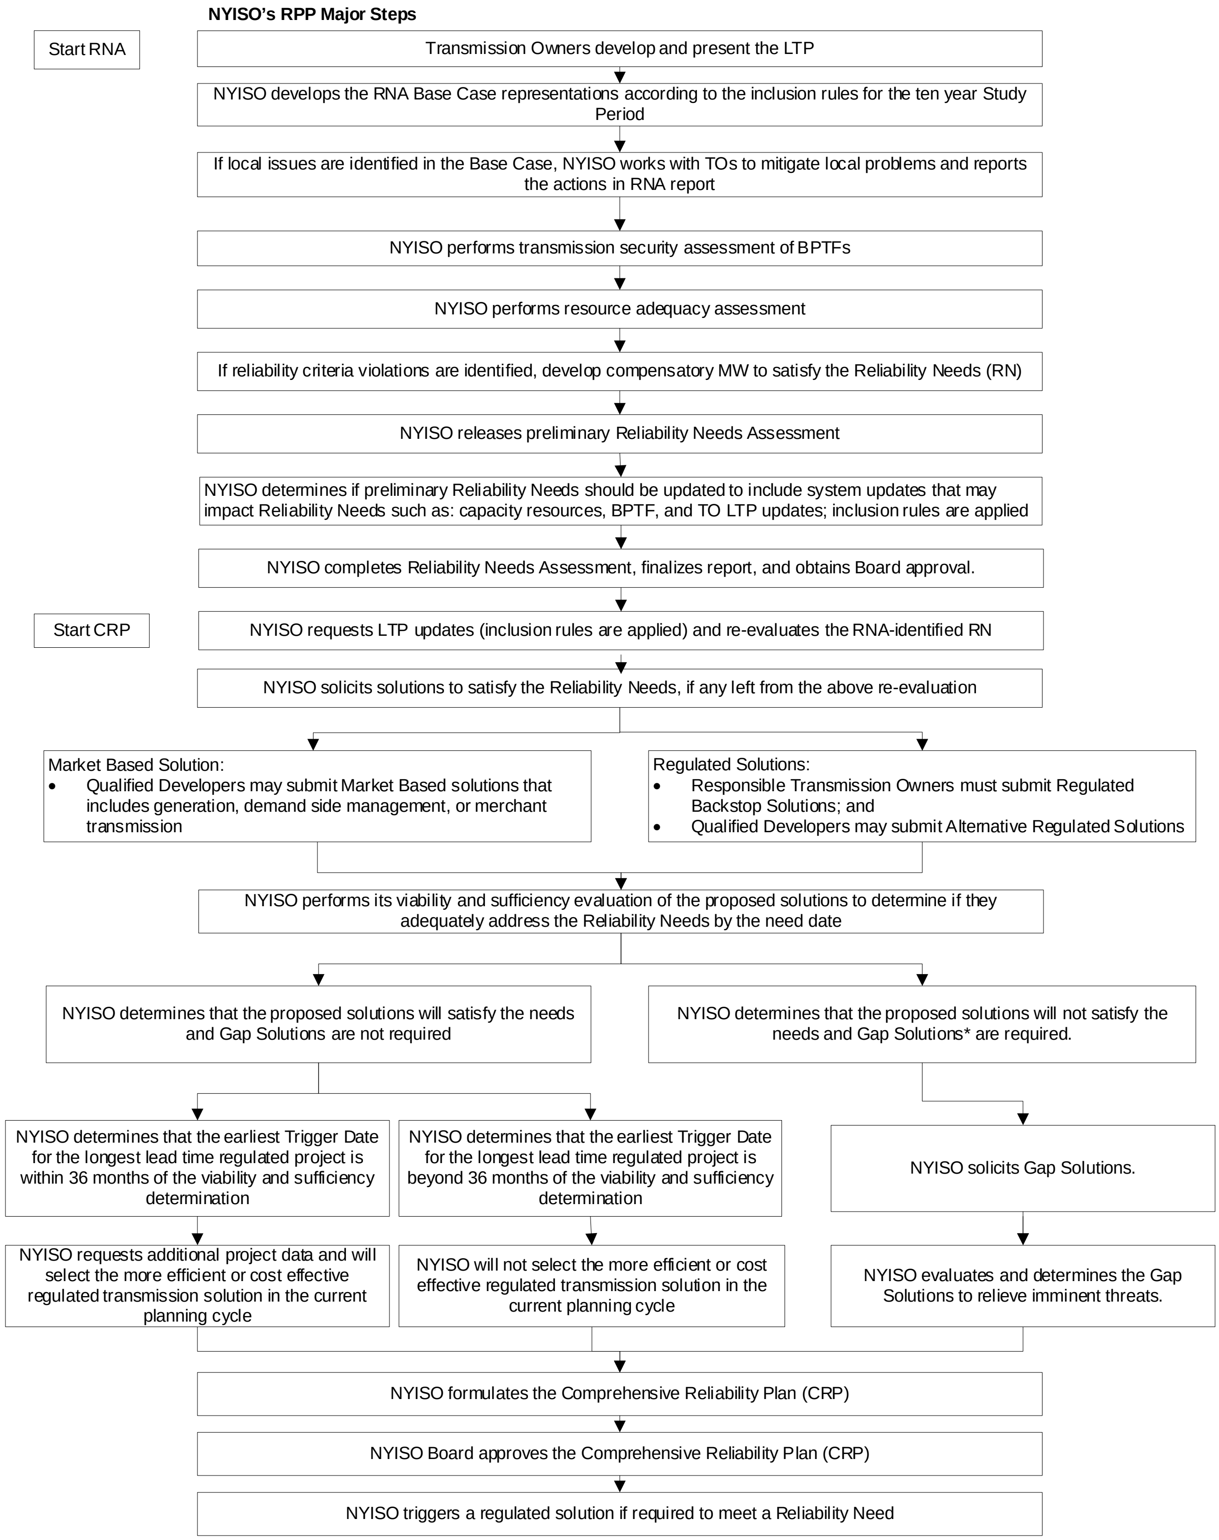

Notes:
* If an immediate threat to the reliability of the power system is identified, a Gap Solution outside of the normal RPP cycle may be requested by the NYISO Board.

Appendix C - Load and Energy Forecast 2018-2028

Summary

In order to perform the 2018 RNA, a forecast of summer and winter peak demands and annual energy requirements was produced for the years 2018 - 2028. The electricity forecast is based on projections of New York's economy performed by Moody's Analytics in August 2017. The forecast includes detailed projections of employment, output, income, and other factors for twenty-three regions in New York State. This appendix provides a summary of the electric energy and peak demand forecasts and the key economic input variables used to produce the forecasts. Figure 3 provides a summary of key economic and electric system growth rates from 2007 to 2028.

Figure 3: Summary of Economic & Electric System Growth Rates – Actual & Forecast

	Average Annual Growth			
	2007-2012	2012-2017	2018-2023	2023-2028
Total Employment	0.18%	1.57%	0.52%	0.34%
Gross State Product	1.43%	0.90%	1.51%	1.47%
Population	0.49%	0.13%	0.00%	0.02%
Total Real Income	1.20%	1.95%	1.47%	1.60%
Weather Normalized Summer Peak	-0.20%	-0.12%	-0.38%	0.11%
Weather Normalized Annual Energy	-0.33%	-0.83%	-0.33%	0.04%

Historic Overview

The New York Control Area (NYCA) is a summer peaking system and its summer peak grew faster than annual energy and winter peak over the period from 2007 to 2017 on a weather-adjusted basis. Both summer and winter peaks show considerable year-to-year variability due to the influence of peak-producing weather conditions for the seasonal peaks. Annual energy is influenced by weather conditions over the entire year, which is much less variable than peak-producing conditions.

Figure 4 below reports the NYCA historic seasonal peaks and annual energy growth since 2007. The table provides both actual results and weather-normalized results, together with annual average growth rates for each table entry. The growth rates are averaged over the period 2007 to 2017.

Figure 4: Historic Energy and Seasonal Peak Demand - Actual and Weather-Normalized

	Annual Energy- GWh		Summer Peak - MW		Winter Peak- MW		
Year	Actual	Weather Normalized	Actual	Weather Normalized	Year	Actual	Weather Normalized
2007	167,339	166,173	32,169	33,444	2007-08	25,021	25,490
2008	165,612	166,468	32,433	33,670	2008-09	24,673	25,016
2009	158,780	161,908	30,845	33,063	2009-10	24,074	24,537
2010	163,505	161,513	33,453	32,458	2010-11	24,654	24,452
2011	163,329	162,628	33,867	33,019	2011-12	23,901	24,630
2012	162,840	163,458	32,439	33,106	2012-13	24,659	24,630
2013	163,514	163,473	33,956	33,502	2013-14	25,739	24,610
2014	160,059	160,576	29,782	33,291	2014-15	24,648	24,500
2015	161,572	159,884	31,139	33,226	2015-16	23,319	24,220
2016	160,798	159,169	32,075	33,225	2016-17	24,164	24,416
2017	156,370	156,795	29,699	32,914	2017-18	25,081	24,265
	-0.68%	-0.58%	-0.80%	-0.16%		0.02%	-0.49%

Forecast Overview

Figure 5 below shows historic and forecast growth rates of annual energy and summer peak demand for four different regions in New York and in total. The four regions are Zones A to F, Zones G to I, Zone J, and Zone K.

Figure 5: Annual Energy and Summer Peak Demand - Actual & Forecast

	Annual Energy- GWh					Summer Coincident Peak - MW				
Year	A to F	G to I	J	K	NYCA	A to F	G to I	J	K	NYCA

Forecast Methodology

The NYISO methodology for producing the long-term forecasts for the Reliability Needs Assessment is described below.

End-use forecasts were developed for zonal energy using monthly data from 2006 through 2017. For each zone, the NYISO estimated a statistically-adjusted end use model of total energy in a zone. The inputs to the model included economic drivers (such as employment and population), cooling degree days, and heating degree days, and trends in technologies for major residential and commercial end uses, such as lighting, cooling, refrigeration, and others. Each zonal forecast was evaluated and compared to historic data, both actual and weather-adjusted usage. The zonal model chosen for the forecast was the one that best represented recent history and the regional growth for that zone. The NYISO also received and evaluated forecasts from all Transmission Owners, which were used in combination with the forecasts the NYISO developed.

The NYISO derive summer & winter non-coincident and coincident peak forecasts from the end use models and compared the results to a method that relied upon trend in load factors. The 2018 summer peak forecast was matched to coincide with the 2018 ICAP forecast.

Demand Side Management

The NYISO developed individual energy and demand forecasts for:

- Energy efficiency impacts;
- Building codes and appliance standards;
- Distributed generation;
- Behind-the-meter solar photovoltaic (PV); and
- Electric vehicles.

The NYISO considered the following factors in developing the 2018 RNA baseline forecast:

- NYPSC-approved spending levels for the programs under its jurisdiction, as described in the Clean Energy Fund Order and related information from NYSERDA;
- Expected realization rates, participation rates, and timing of planned energy efficiency programs;
- Impacts of new appliance efficiency standards, and building codes and standards;
- Specific energy efficiency plans proposed by Long Island Public Authority, The Power Authority of the State of New York, and Consolidated Edison Company of New York, Inc.;
- Results of residential and commercial surveys prepared by NYSERDA and the US Energy Information Administration;
- Actual and projected impacts of behind-the-meter solar PV installations; and
- Actual and projected impacts of distributed energy generation installation.

Once the energy and demand trends of these impacts were developed, the NYISO produced zonal level forecasts by incorporating these end use trends into the statistically adjusted end-use models.

Appendix D - Transmission System Security and Resource Adequacy Assessments

The analysis performed during the Reliability Needs Assessment requires the development of base cases for transmission security analysis and for resource adequacy analysis. The power flow system model is used for transmission security assessment and also for the development of the transfer limits to be implemented in the Multi-Area Reliability Simulation (MARS) model. The NYISO conducts comprehensive assessment of the transmission system through a series of steady-state power flow, transient stability, and short circuit studies.

The NYISO used the MARS model to determine whether adequate resources would be available to meet the NYSRC and NPCC reliability criteria of one day in ten years (0.1 days/year). The results showed no resource adequacy needs in any of the ten-year Study Period (i.e., 2019 to 2028). The MARS model was also used to evaluate selected scenarios.

2018 RNA Assumption Matrix

#	Parameter	2016 RNA/CRP Study Period: 2017 (y1) - 2026 (y10)	2018 RNA Study Period: 2019 (y1) - 2028 (y10)
Load Parameters			
1	Peak Load Forecast	Adjusted 2016 Gold Book NYCA baseline peak load forecast. The GB 2016 baseline peak load forecast includes the impact (reduction) of behind-the-meter (BtM) solar at the time of NYCA peak. For the Resource Adequacy load model, the deducted BtM solar MW was added back to the NYCA zonal loads, which then allows for a discrete modeling of the BtM solar resources.	Adjusted 2018 Gold Book NYCA baseline peak load forecast. The GB 2018 baseline peak load forecast includes the impact (reduction) of behind-the-meter (BtM) solar at the time of NYCA peak. 6	Retirements, Mothballed units, IIFO	GB2016 with Inclusion Rules Applied	GB2018 with Inclusion Rules Applied
7	Forced and Partial Outage Rates	Five-year (2011-2015) GADS data for each unit represented. Those units with less than five years – use representative data. Transition Rates representing the Equivalent Forced Outage Rates (EFORd) during demand periods over the most recent five-year period	Five-year (2013-2017) GADS data for each unit represented. Those units with less than five years – use representative data. Transition Rates representing the Equivalent Forced Outage Rates (EFORd) during demand periods over the most recent five-year period

#	Parameter	2016 RNA/CRP Study Period: 2017 (y1) - 2026 (y10)	2018 RNA Study Period: 2019 (y1) - 2028 (y10)
8	Planned Outages	Based on schedules received by the NYISO and adjusted for history	Based on schedules received by the NYISO and adjusted for history
9	Summer Maintenance	n/a	Nominal MW
10	Combustion Turbine Derates	Derate based on temperature correction curves	Derate based on temperature correction curves
11	Landfill gas plants	The landfill gas units are assumed to be 2-state units.	New method: Actual hourly plant output over the period 2013-2017. Program randomly selects a LFG shape of hourly production over the 2013-2017 for each model replication.
12	Existing Wind Units (>5 years of data)	Actual hourly plant output over the period 2011-2015. Probabilistic model is incorporated based on five years of input shapes with one shape per replication being randomly selected in Monte Carlo process	Actual hourly plant output over the period 2013-2017. Probabilistic model is incorporated based on five years of input shapes with one shape per replication being randomly selected in Monte Carlo process
13	Existing Wind Units (<5 years of data)	For existing data, the actual hourly plant output over the period 2011-2015 is used. For missing data, the nameplate normalized average of units in the same load zone is scaled by the unit's nameplate.	For existing data, the actual hourly plant output over the period 2013-2017 is used. For missing data, the nameplate normalized average of units in the same load zone is scaled by the unit's nameplate.
14	Proposed Wind Units	Inclusion Rules Applied to determine the generating unit status. The nameplate normalized average of units in the same load zone is scaled by the unit's nameplate.	Inclusion Rules Applied to determine the generating unit status. The nameplate normalized average of units in the same load zone is scaled by the unit's nameplate.
15	Utility-scale Solar Resources	The 31.5 MW metered solar capacity: probabilistic model chooses from 4 years of production data output shapes covering the period 2012-2015. One shape per replication is randomly selected in Monte Carlo process.	The 31.5 MW Upton metered solar capacity: probabilistic model chooses from 5 years of production data output shapes covering the period 2013-2017. One shape per replication is randomly selected in Monte Carlo process.

#	Parameter	2016 RNA/CRP Study Period: 2017 (y1) - 2026 (y10)	2018 RNA Study Period: 2019 (y1) - 2028 (y10)
16	BtM Solar Resources	The large projection of increasing retail (BtM) solar installations over the 10- year period required a discrete model with some level of detailed hourly performance. 5 years of hourly historic irradiance data from 18 stations in NY was used to develop the required hourly patterns to discretely model this resource. (One shape per replication is randomly selected in Monte Carlo process.)	The large projection of increasing retail (BtM) solar installations over the 10- year period required a discrete model with some level of detailed hourly performance. New method: 8760 hourly shapes are created by using NREL's PV Watt tool *(NREL's PVWatts Calculator, credit of the U.S. Department of Energy (DOE)/NREL/Alliance (Alliance for Sustainable Energy, LLC)*. The shapes are applied during the load adjustment to account for the impact of the BtM generation on both on peak and off peak hours. MARS will randomly select a daily shape from the current month for each day of each month of each replication.
17	BTM-NG Program	n/a	New category: These are former load modifiers to sell capacity into the ICAP market. Model as cogen type 2 unit in MARS. Unit capacity set to CRIS value, load modeled with weekly pattern that can change monthly.
18	Small Hydro Resources	Review of 5- years of unit production data over the years 2011 to 2015 with applicable deration: 46% derate applied to all Run-of-River units, calculated by reviewing unit contribution during peak hours of summer months	New method: Actual hourly plant output over the period 2013-2017. Program randomly selects a Hydro shape of hourly production over the 2013-2017 for each model replication.
19	Large Hydro	Probabilistic Model based on 5- years of GADS data. Transition Rates representing the Equivalent Forced Outage Rates (EFORd) during demand periods over the most recent five-year period (2011-2015). Methodology consistent with thermal unit transition rates.	Probabilistic Model based on 5- years of GADS data. Transition Rates representing the Equivalent Forced Outage Rates (EFORd) during demand periods over the most recent five-year period (2013-2017). Methodology consistent with thermal unit transition rates.
20	Capacity Purchases	Grandfathered Rights and other awarded long-term rights including 20 MW CRIS potentially awarded to HQUS in CY15, additional to the existing 1,090 MW. Modeled using MARS explicit contracts feature.	Grandfathered Rights and other awarded long-term rights Modeled using MARS explicit contracts feature.

#	Parameter	2016 RNA/CRP Study Period: 2017 (y1) - 2026 (y10)	2018 RNA Study Period: 2019 (y1) - 2028 (y10)
Transaction - Imports / Exports			
21	Capacity Sales	These are long-term contracts filed with FERC. Modeled as equivalent contracts sold from ROS (surplus Zones: A,C,D,F,F1). ROS ties to external pool are derated by sales MW amount	These are long-term contracts filed with FERC. Modeled using MARS explicit contracts feature. Contracts sold from ROS (Zones: A-F). Assumption Matrix for Transmission Security Assessment

Parameter	2018 RNA Transmission Security Studies Modeling Assumptions	Source
Peak Load	NYCA baseline coincident summer peak forecast, which already includes EE and DG (including BtM solar) reductions	2018 Gold Book
Load model	ConEd: voltage varying	2018 FERC 715 filing
	Rest of NYCA: constant power	
System representation	Per updates received through Databank process (Subject to RNA base case inclusion rules)	NYISO RAD Manual, 2018 FERC 715 filing
Inter-area interchange schedules	Consistent with ERAG MMWG interchange schedule	2018 FERC 715 filing, MMWG
Inter-area controllable tie schedules	Consistent with applicable tariffs and known firm contracts or rights	2018 FERC 715 filing
In-city series reactors	Consistent with ConEdison operating protocol (all series reactors in-service for summer)	2018 FERC 715 filing, ConEd protocol
SVCs, FACTS	Set at zero pre-contingency; allowed to adjust post-contingency	NYISO T&D Manual
Transformer & PAR taps	Taps allowed to adjust pre-contingency; fixed post-contingency	2018 FERC 715 filing
Switched shunts	Allowed to adjust pre-contingency; fixed post-contingency	2018 FERC 715 filing
Fault current analysis settings	Per Fault Current Assessment Guideline	NYISO Fault Current Assessment Guideline

RNA Power Flow Base Case Development and Thermal Transfer Limit Results

Development of RNA Power Flow Base Cases

The NYISO developed the 2018 RNA Base Cases used in analyzing the performance of the transmission system from the 2018 FERC 715 filing power flow case library. The load representation in the power flow model is the summer peak load forecast reported in the 2018 Gold Book Table 1-3a baseline forecast of coincident peak demand. The system representation for the NPCC Areas in the base cases is from the 2017 Base Case Development libraries compiled by the NPCC SS-37 Base Case Development working group. The NYISO derived the PJM system representation from the PJM Regional Transmission Expansion Plan (RTEP) planning process models. The remaining models are from the Eastern Interconnection Reliability Assessment Group (ERAG) Multiregional Modeling Working Group (MMWG) 2017 power flow model library.

The NYISO utilized the RNA Base Case inclusion rules to screen the projects and plans for inclusion or exclusion from the 2018 RNA Base Case. The NYISO revised the RNA Base Case inclusion rules as; set forth in Section 3 of the Reliability Planning Process Manual (Manual 26).

Specifically, the 2018 RNA Base Case does not include all projects currently listed on the NYISO's interconnection queue or those shown in the 2018 Gold Book. Rather, it includes only those which met the screening requirements, as shown in the Figure 13 of the main report. The generation deactivation assumptions are reflected in Figure12 of the main report. The firm transmission plans included in the RNA Base Case are listed in Figure 12 on the next page.

Emergency Thermal Transfer Limit Analysis

The NYISO performed analyses of the RNA Base Cases to determine emergency thermal transfer limits for the key interfaces used in the MARS resource adequacy analysis. Figure 13 below reports the emergency thermal transfer limits for the RNA base system conditions.

Figure 13: Emergency Thermal Transfer Limits

Interface	2023	
Dysinger East	2300	1
Volney East	5650	2
Moses South	2650	3
Central East MARS	4450	4

2018 RNA MARS Model Base Case Development

The NYISO developed the system representations for PJM, Ontario, New England, and Hydro Quebec modeled in the 2018 RNA Base Case from the NPCC CP-8 2017 Summer Assessment. To avoid overdependence on emergency assistance from the external areas, the emergency operating procedure data was removed from the model for each external area. In addition, the capacity of the external areas was further modified such that the LOLE value of each external area was a minimum value of 0.10 and capped at a value of 0.15 through year 10.

The topology used in the MARS model RNA Base Case is located in Figures 21 to 24 in the body of the report. The internal transfer limits modeled are the summer emergency ratings derived from the RNA power flow cases discussed above. The NYISO developed external transfer limits from the NPCC CP-8 Summer Assessment MARS database with changes based upon the RNA Base Case assumptions.

2018 RNA Short Circuit Assessment

Figure 15 below provides the results of NYISO's short circuit screening test for year 5 (2023) of the Study Period. Individual Breaker Analysis (IBA) is required for any breakers the ratings of which were exceeded by the maximum bus fault current. Either NYISO or the responsible Transmission Owner performed the analyses.

2018 RNA Transmission Security Violations

The preliminary transmission security assessment identified a Reliability Need in year 10 (2028) in Eastern Long Island. A LIPA LTP update at the June 28 ESPWG/TPAS meeting resolved this Reliability Need. Also, the transmission security assessment observed thermal violations in year 1 (2019); however, these overloads are not considered Reliability Needs because the Responsible TOs have LTPs identified in the 2018 Gold Book to address them, and will use interim operating procedures to maintain the security of the system until the LTPs are placed in-service. Year 1, year 5, and year 10 were studied and the top 10 BPTF violations identified in the analyses are shown in Figure 16 on the next page. The mitigation plans are discussed in the report.

Figure 16: 2018 RNA Transmission Security Analysis Summary Table
