Notes:

The ability to update fuel index types and the corresponding fuel burden available to the generator for Day-Ahead and Real-Time reference levels continues to be available through the RLS

All Day-Ahead or Real-Time generator bids that include fuel information are validated against the above listed Dollar and Percent thresholds as well as RLS permissions before reference prices are

The ability to have Real-Time reference prices adjusted at market close using fuel information entered on the generator bid has been active since October 2010.

The ability to have Day-Ahead reference prices adjusted at market close using fuel information entered on the generator bid has been activated in June 2014.

To learn more about the validation calculations, refer to the RLS User's Guide Appendix B for sample calculations.

The RLS Users Guide is available on the NYISO website.

Fuel price thresholds are based on an analysis of July and August data from 2019 – 2023.

Group fuel type thresholds based on difference in price of the two fuel types plus \$7/mmBtu, recent one-month ave (data 4/12/24-5/14/24).
