Description of Work: Upgrades to the existing LIPA Oakwood Substation, located in the Hamlet of West Hills in the Town of Huntington in Suffolk County. Oakwood Substation is a 138 KV AIS substation with a 2-bus configuration with a tie breaker. The proposed Solution will re-classify the existing Greenlawn feeder pothead stand and connection as the second leg of the upgraded 2-cable circuit configuration from Oakwood to Syosset circuit and connect the re-classified Oakwood to Syosset second leg to the station via installation of a PASS circuit breaker. The Solution will also remove the existing aerial to underground connection for the existing Greenlawn to Syosset circuit, then install a new Greenlawn to Syosset Transition underground to overhead connection at an alternate location adjacent to the station. The additional circuit to be installed will connect to this revised connection point

Description of Work: I Upgrades to the existing LIPA Syosset Transition Station, located near Woodbury Road in the Hamlet of Woodbury in the Town of Oyster Bay in Nassau County. Syosset Transition Station is a 138 KV underground to overhead transition station with two (2) transition pothead stands.

Description of Work: reconductoring/conversion of an existing LIPA 138 kV circuit between the East Garden City Substation in the Hamlet of Uniondale in the Town of Hempstead in Nassau County, to the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County, via the Newbridge Road Substation in the Hamlet of East Meadow in the Town of Hempstead in Nassau County. A new 0.6 mile 345 kV line will be spliced to the existing line, creating a continuous 345 kV feed between the substations. The routing would be the existing underground routing using the LIPA-owned transmission corridors.

Description of Work: The proposed 345 kV and 138 kV electric underground transmission lines extending from the East Garden City Substation in the Hamlet of Uniondale in the Town of Hempstead in Nassau County to the Shore Road Substation in the Glenwood Landing Hamlet in Nassau County. The proposed route will be approximately 10.3 miles, utilizing 4000 kcmil XLPE cable for the route.

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

Ruland Road to Shore Road segment is 17.82 miles

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

Shore Road to New Rochelle segment is 10.22 miles, Submarine segment is 8.63 miles (included the HDD section).

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

Ruland Road to Shore Road segment is 17.82 miles

Description of Work: The proposed 138 kV electric underground transmission line begins at the Syosset Substation in the Hamlet of Woodbury in the Town of Oyster Bay in Nassau County leading to the Shore Road Substation in the Hamlet of Glenwood Landing in the Town of Oyster Bay in Nassau County. The proposed route will be approximately 11.3 miles, utilizing 4000 kcmil XLPE cable

Propel NY - TO51 AS5	
ESTIMATE ASSUMPTIONS & CLARIFICATIONS	
General assumptions/clarifications	
1	This TO51 estimating workbook includes the substation and transmission line components listed in the sheet.
2	Based on 2022 pricing
3	The estimate contains 20% contingency amount. To cover unknow risk allowance. Costs include contractor mark-up (6%-trunkey cost (i.e. HVDC, GIS), 18%-others) for OH and profit
4	Costs have been developed based on historical data from Projects of a similar nature (AACE Class 5 and 4 Estimating Practices). Major equipment pricing is based on budgetary quotes from equipment suppliers. However, we have not engaged any subcontractors or material venders for formal quotes for minor materials.
5	Cost for dust control is excluded, we assume that water trucks for construction are not required.
6	Excavation currently excludes rock. More detail required to quantify rock, as well as construction means and methods allowed. Rock adder is approximately \$405/CY for standard rock excavation.
7	Work schedule assumes working 5 days per week, 10 hours per day. The construction durations for each segment are based on Attachment B.04.1 Addendum Construction Schedule Revision 0.
8	Pricing assumes union labor will be required.
9	In indirect section, we assume that these construction contracts will be let on an EPC type basis (perhaps progressive design-build or similar contracting model) and that the construction contractor would have significant input into the pre-con planning stage. The project management staffing make up is based on the project scope and duration, for the substation interconnection/upgrade project (expect East Garden City station) only assume one construction manager and one environmental coordinator to meet EMCP requirement.
10	Cost s will vary for handling and disposal of contaminated spoils, depending on type of contaminants and availability / location of the appropriate tippy facility. Since there is not enough information to provide a quantified estimate for this item, allowance is included in the contingency monies.
11	An allowance of 5% for transmission design and engineering is included in indirect section, cost of turnkey GIS and HVDC excluded
12	An allowance of 8% for substation design and engineering is included in indirect section, cost of turnkey GIS and HVDC excluded
13	An allowance of 0.3% for GPR of the transmission line is included in indirect section
14	An allowance of 0.7% for survey and staking of the tline and substation layout is included in indirect section, cost of turnkey GIS and HVDC excluded for substations.
15	An allowance of 3.75% for substation testing and commissioning is included in indirect section, cost of turnkey GIS and HVDC excluded
16	An allowance of \$20,000 per circuit for transmission line testing and commissioning is included in indirect section
17	An allowance of 1% for environmental Licensing & Permitting Costs & related legal cost is included in indirect section; and cost for environmental-special studies/investigation is quantified and included for required segment. Cost of turnkey GIS and HVDC excluded for substations.
18	The estimate does not include cost for insurance, assume it will be provided by he owner (i.e. OCIP) . The estimate includes cost for bond (2% of the total contract value)
19	New York State sales tax of 8.8% is included for all material pricing
20	A mob of 3% and demob of 2% has been included per segment (percentage is based on construction labor and equipment costs), except submarine segment.
21	An allowance of 1% for Preconstruction Supervision (Engineering, Permitting, Procurement) is included in indirect section.
22	An allowance of 4% for Project Management & Staffing (includes PM, Field Engineers / Supervision, Scheduler and Cost Manager, SHEQ Staff, and Admin Staff) is included in indirect section.
23	An allowance of 1% for Utility PM and Project Oversight is included in indirect section.
24	An allowance of 1% for Site Accommodation, Facilities, Storage is included in indirect section.
25	An allowance of 3% of the real estate acquisition cost is included for real estate legal fees.
Tline assumptions/clarifications	
21	Assumed all UG conduits are installed with concrete encasement and no splicing point included inside substations. The conduit trench details please refer to each tab.
22	Not enough detail to quantify existing utility relocation. A plug of \$1M per mile has been included for relocation of existing utilities and \$200K / mile for protection of existing utilities.
23	Traffic control allows for k-rail, metal sheet plates and lane control for underground sections. We have not included for construction of new roads or any permanent traffic measures.
24	The trench excavation width and depth assumed details are shown in each tab.
25	The MH counts are based on our field and desktop review
26	Assumes that 30% of native spoils from vault excavation will be used as backfill.
27	Off haul / disposal spoils quantity includes a 1.3X multiplier for truck load.
28	Assumed asphalt paving repair includes a 2" surfacing course pavement
29	Additional 5% of route length is added to UG cable length, 10% of route length added to submarine cable length
30	All Tline segments construction period is based on the provided milestone schedule.
31	Shore Road to Sprainbrook 345kv UG line, assume Shore Road to New Rochelle is 4-circuit, New Rochelle to Sprainbrook is 2 -circuit.
32	The submarine cable quantity and cost are calculated based on # of passes and the total cable length. We assume i.e 1 circuits, 2 cable per circuit, so there are 2 passes.
33	For transmission lines that are routed on the west side of the LI Sound (Bronx and Westchester County) assume 40% rock excavation.
Substation assumptions/clarifications	
33	Site grading: Excavation quantity in substations is based on 3', fill quantity is based on 60% site borrow and 40% import.
34	Substation new access road access road quantity is based on interior access road only, no new exterior access roads are required based on the plot drawings provided.
35	Substation pad is based on 8" base and 6" surfacing rock.
36	The firewalls for transformers/PAR/Reactors are assumed 30' tall, if required
37	All of the enclosure buildings are based on dimensions shown on the site plot plan, cost includes pre-engineered building structure, HVAC, mechanical, fire protection.
38	Costs for precast concrete piles (12"x80') were included in several substations by developer, there are no drawings nor geo technical report to verify if it is required and the quantities. We assumed it is required and included the costs based on developer's quantities.
39	The control panels quantities and values are provided by Sub Station Engineers.

Description of Work: New, greenfield substation to be called “New Rochelle Substation,” which would be 345 kV and located near 60 Echo Avenue in the City of New Rochelle, Westchester County. The substation would allow for the transition of electric submarine transmission cables to electric underground transmission cables at a location outside of the shoreline of Long Island Sound.

Description of Work: new 345/ 138 kV GIS substation in Eastern Queens at a vacant utility owned property in the area of 180th Street and Brinkerhoff Avenue. The configuration of the station would include an eight six position 345 kV GIS ring bus which will allow for interconnection of the 3 underground circuits from Barrett Substation and the two circuits that connect to Tremont and Dunwoodie Substations. In addition, there will be 3 – 345/138kV autotransformers that connect to the 345 kV bus. Two of the autotransformers will feed a new 138 kV four breaker ring bus that will interconnect to the 901 and 903 circuits that will connect to Jamaica Substation. Each of the feeders that interconnect to Jamaica will be PAR controlled. The third autotransformer, with 138 kV PAR will feed a sperate new 138 kV four breaker ring bus that will interconnect with the 901 and 903 circuits that will connect to Valley Stream and Lake Success Substations. The existing PARs at Lake Success and Valley Stream will be removed.

Description of Work: New greenfield 345 kV Shore Road Substation, to be located at 375 Shore Road, in the Hamlet of Glenwood Landing, Town of Oyster Bay, Nassau County. The 345 kV Shore Road Substation will serve as the transition station and new connection for the existing LIPA) 138 kV Shore Road Substation. Two (2) new 345 kV underground terrestrial transmission lines with a PAR on each circuit will be converted into four (4) marine transmission lines for crossing Long Island Sound. Also, a 345 kV/138 kV power transformer in series with a 138 kV PAR will connect to the existing LIPA 138 kV substation. Lastly, three(3) 345 kV shunt reactors will be installed for compensation.

Description of Work: New greenfield 345 kV/138 kV Ruland Road Substation, to be located on Ruland Road in the Hamlet of Melville, Town of Huntington, Suffolk County. The New substation will consist of a 138 kV air insulated switchgear (“AIS”) six (6) position ring bus substation and a 345 kV AIS six (6) position ring bus substation interconnected by three (3) 345 kV/138 kV power transformers.

Description of Work: new greenfield 345 kV Barrett Substation, to be located near 4005 Daly Boulevard, in the Hamlet of Oceanside, Town of Hempstead, Nassau County. The New 345 kV Barrett Substation will serve as the main Point of Interconnection (“POI”)between the generation and transmission operator. The New substation will step up the 138 kV POI voltage to 345 kV, and a new 345 kV underground line will be connected

Description of Work: The existing Consolidated Edison Company of New York, Inc. (“Con Edison”) Tremont Substation, located in the Borough of the Bronx, New York City, Bronx County. Tremont Substation is an existing 345 kV AIS substation fed by a single underground 345 kV Line, X-28, which is a Con Edison transmission circuit. The X-28 circuit is connected to a common rigid bus that feeds two (2) 345 kV / 138 kV transformers in parallel. The Solution consists of the termination of a new 345 kV circuit, which requires installing a new 345 kV GIS six-position ring bus within the existing fence-line of the substation.

Description of Work: Interconnection Facilities to the existing Con Edison Sprain Brook Substation, located in the City of Yonkers, Westchester County. Sprain Brook Substation is an existing 345 kV AIS substation with a BAAH configuration. The Solution includes installing two new underground 345 kV lines each with a shunt reactor each, in the new bay position

Description of Work: Upgrades and Potential Interconnection Facilities to the existing LIPA Ruland Road Substation, located in the Hamlet of Melville, Town of Huntington, Suffolk County. Ruland Road Substation is an existing 138 kV AIS substation configured with six (6) BAAH bays. The Solution includes installing two (2) air core reactors in series to the 138 kV Lines 138-561 and 138-562, respectively, which are proposed as Upgrades and two (2) 138 kV circuit breakers, which are proposed as Potential Interconnection Facilities.

Description of Work: Interconnection Facilities to the existing LIPA Shore Road Substation, located in the Hamlet of Glenwood Landing, Town of Oyster Bay, Nassau County. Shore Road Substation is an existing 138 kV AIS substation with a main-tie main configuration. The Solution includes installing two (2) additional circuit breakers to create a six (6) position ring bus configuration.

Description of Work: interconnection facilities to the existing ConEd Dunwoodie Substation, located in the City of Yonkers, Westchester County. The Dunwoodie Substation includes an existing 345 kV GIS six (6) breaker ring. It is proposed that an additional braker be added to the ring to allow for interconnection of the new underground line from the Eastern Queens substation.

Description of Work:The Applicants propose Upgrades to the Holbrook Substation, which is an existing LIPA 138 kV AIS substation, configured as an eight (8) position ring bus. The Holbrook Substation is located in the Hamlet of Holbrook in the Town of Brookhaven in Suffolk County.The 138 kV, 138-882 Line currently feeds two (2) 138 kV/69 kV transformers via an AIS disconnect before connecting into its bus section within the ring bus. The Solution involves replacing the existing switch #1322 with a new hybrid PASS GIS 138 kV breaker system with integrated disconnect and ground switches.

Description of Work: Upgrades to the existing LIPA 138 kV Newbridge Substation, located in the Town of Hempstead, Nassau County. Newbridge Substation is an existing 138 kV AIS substation with a six (6) bay BAAH configuration and 138 kV/69 kV transformers connected to each main bus. The Solution includes the addition of a new breaker in series with the existing 138 kV CB -1460, providing an additional contingency to the 138 kV Lines 138-465 and 138-461

Description of Work: Upgrades to the existing LIPA East Garden City Substation, Hamlet of Uniondale, Town of Hempstead, Nassau County. The LIPA East Garden City Substation is an existing 138 kV AIS substation with a ten (10) position ring bus configuration.The Solution includes the installation of three (3) air core reactors with by-pass circuit, in series, to the 138 kV lines 138-462,138-465, and 138-463, respectively. Due to current site constraints, the new series reactors will be installed in the property adjacent to the existing station

Description of Work: Upgrades to the existing Con Edison Rainey Substation, located in the Borough of Queens, City of New York, Queens County. The Rainey Substation is an existing 345 kV AIS substation configured with a six (6) line position ring bus tied with an eight (8) line position ring bus in the same yard. The Solution includes the addition of two new breakers in series with the existing 345 kV CB -1E and CB-6E respectively, providing an additional contingency level.

Description of Work: Upgrade to the 345 kV East Garden City Substation, to be located at 555 Stewart Avenue, Hamlet of Uniondale, Town of Hempstead, Nassau County. The New 345 kV East Garden City Substation will be connected by six (6) new 345 kV underground transmission lines and the existing Y-49 Line. Also, it will serve the two (2) existing 345 kV/138 kV transformers located in the existing LIPA 138 kV East Garden City Substation

Description of Work: Interconnection Facilities to the existing LIPA Syosset Substation, located in the Hamlet of Syosset, Town of Oyster Bay, Nassau County. Syosset Substation is a 138 kV AIS substation with an eight (8) ring bus configuration. The Solution includes the installation of a new underground 138 kV line with a PAR in an existing spare line position.

Description of Work: The proposed 345 kV electric underground transmission line extending from the Barrett Substation in the Hamlet of Oceanside in the Town of Hempstead in Nassau County to the Tremont Substation in the Bronx, New York City, Bronx County with a connection point at the East Garden City Substation in the Hamlet of Uniondale in the Town of Hempstead, Nassau County. The proposed route will be approximately 32.3 miles, utilizing 4000 kcmil cross-linked polyethylene (“XLPE”)cable for the onshore portions of the route and 5000 kcmil cable in a marine crossing by Horizontal Directional Drill (“HDD”) or equivalent trenchless technique.
Barrett to EGC section is 8.76 miles

Description of Work: The proposed 345 kV electric underground transmission line extending from the Barrett Substation in the Hamlet of Oceanside in the Town of Hempstead in Nassau County to the Tremont Substation in the Bronx, New York City, Bronx County with a connection point at the East Garden City Substation in the Hamlet of Uniondale in the Town of Hempstead, Nassau County. The proposed route will be approximately 32.3 miles, utilizing 4000 kcmil cross-linked polyethylene (“XLPE”)cable for the onshore portions of the route and 5000 kcmil cable in a marine crossing by Horizontal Directional Drill (“HDD”) or equivalent trenchless technique.
Barrett to EGC section is 23.46 miles

Description of Work: The proposed 345 kV and 138 kV electric underground transmission lines extending from the East Garden City Substation in the Hamlet of Uniondale in the Town of Hempstead in Nassau County to the Shore Road Substation in the Glenwood Landing Hamlet in Nassau County. The proposed route will be approximately 10.3 miles, utilizing 4000 kcmil XLPE cable for the route.

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

Ruland Road to Shore Road segment is 17.82 miles

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

Shore Road to New Rochelle segment is 10.22 miles, Submarine segment is 8.63 miles (included the HDD section).

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.
Ruland Road to Shore Road segment is 17.82 miles

Description of Work: The 901 circuit from the point of interception will require an approximate 0.5 double circuit 138 kV construction utilizing 4000kcmil XLPE cable. At the point of intercept for the portion of the 901 cable going to Jamaica an oil stop transition joint will be utilized. Due to the fact that the portion of the 901 cable towards Valley Stream will be limiting it is proposed that that 6 mile portion of the cable will be upgraded using 4000kcmil XLPE cable.

Description of Work: The 903 circuit from the point of interception will require an approximate 2.5 mile double circuit 138 kV construction utilizing 4000kcmil XLPE cable. At the point of interception oil stop transition joints are proposed to connect to the existing cables.

Description of Work: . It is currently anticipated that a similar route from the point of intercept to Valley Stream Substation would be utilized and would interconnect at the location of the existing 901 circuit. The portion of the existing 901 cable from the point of intercept to the Valley Stream Substation would likely be retired.

Description of Work: reconductoring/conversion of an existing LIPA 138 kV circuit between the East Garden City Substation in the Hamlet of Uniondale in the Town of Hempstead in Nassau County, to the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County, via the Newbridge Road Substation in the Hamlet of East Meadow in the Town of Hempstead in Nassau County. A new 0.6 mile 345 kV line will be spliced to the existing line, creating a continuous 345 kV feed between the substations. The routing would be the existing underground routing using the LIPA-owned transmission corridors.

Description of Work: New, greenfield substation to be called “New Rochelle Substation,” which would be 345 kV and located near 60 Echo Avenue in the City of New Rochelle, Westchester County. The substation would allow for the transition of electric submarine transmission cables to electric underground transmission cables at a location outside of the shoreline of Long Island Sound.

Description of Work: New greenfield 345 kV Shore Road Substation, to be located at 375 Shore Road, in the Hamlet of Glenwood Landing, Town of Oyster Bay, Nassau County. The 345 kV Shore Road Substation will serve as the transition station and new connection for the existing LIPA) 138 kV Shore Road Substation. Two (2) new 345 kV underground terrestrial transmission lines with a PAR on each circuit will be converted into four (4) marine transmission lines for crossing Long Island Sound. Also, a 345 kV/138 kV power transformer in series with a 138 kV PAR will connect to the existing LIPA 138 kV substation. Lastly, three(3) 345 kV shunt reactors will be installed for compensation.

Description of Work: New greenfield 345 kV/138 kV Ruland Road Substation, to be located on Ruland Road in the Hamlet of Melville, Town of Huntington, Suffolk County. The New substation will consist of a 138 kV air insulated switchgear (“AIS”) six (6) position ring bus substation and a 345 kV AIS six (6) position ring bus substation interconnected by three (3) 345 kV/138 kV power transformers.

Description of Work: new greenfield 345 kV Barrett Substation, to be located near 4005 Daly Boulevard, in the Hamlet of Oceanside, Town of Hempstead, Nassau County. The New 345 kV Barrett Substation will serve as the main Point of Interconnection (“POI”)between the generation and transmission operator. The New substation will step up the 138 kV POI voltage to 345 kV, and a new 345 kV underground line will be connected

Description of Work: The existing Consolidated Edison Company of New York, Inc. (“Con Edison”) Tremont Substation, located in the Borough of the Bronx, New York City, Bronx County. Tremont Substation is an existing 345 kV AIS substation fed by a single underground 345 kV Line, X-28, which is a Con Edison transmission circuit. The X-28 circuit is connected to a common rigid bus that feeds two (2) 345 kV / 138 kV transformers in parallel. The Solution consists of the termination of a new 345 kV circuit, which requires installing a new 345 kV GIS six-position ring bus within the existing fence-line of the substation.

Description of Work: Interconnection Facilities to the existing Con Edison Sprain Brook Substation, located in the City of Yonkers, Westchester County. Sprain Brook Substation is an existing 345 kV AIS substation with a BAAH configuration. The Solution includes installing two new underground 345 kV lines each with a shunt reactor each, in the new bay position

Description of Work: Upgrades and Potential Interconnection Facilities to the existing LIPA Ruland Road Substation, located in the Hamlet of Melville, Town of Huntington, Suffolk County. Ruland Road Substation is an existing 138 kV AIS substation configured with six (6) BAAH bays. The Solution includes installing two (2) air core reactors in series to the 138 kV Lines 138-561 and 138-562, respectively, which are proposed as Upgrades and two (3) 138 kV circuit breakers, which are proposed as Potential Interconnection Facilities

Description of Work: Interconnection Facilities to the existing LIPA Shore Road Substation, located in the Hamlet of Glenwood Landing, Town of Oyster Bay, Nassau County. Shore Road Substation is an existing 138 kV AIS substation with a main-tie main configuration. The Solution includes installing two (2) additional circuit breakers to create a six (6) position ring bus configuration.

Description of Work:The Applicants propose Upgrades to the Holbrook Substation, which is an existing LIPA 138 kV AIS substation, configured as an eight (8) position ring bus. The Holbrook Substation is located in the Hamlet of Holbrook in the Town of Brookhaven in Suffolk County.The 138 kV, 138-882 Line currently feeds two (2) 138 kV/69 kV transformers via an AIS disconnect before connecting into its bus section within the ring bus. The Solution involves replacing the existing switch #1322 with a new hybrid PASS GIS 138 kV breaker system with integrated disconnect and ground switches.

Description of Work: Upgrades to the existing LIPA 138 kV Newbridge Substation, located in the Town of Hempstead, Nassau County. Newbridge Substation is an existing 138 kV AIS substation with a six (6) bay BAAH configuration and 138 kV/69 kV transformers connected to each main bus. The Solution includes the addition of a new breaker in series with the existing 138 kV CB -1460, providing an additional contingency to the 138 kV Lines 138-465 and 138-461

Description of Work: Upgrades to the existing LIPA East Garden City Substation, Hamlet of Uniondale, Town of Hempstead, Nassau County. The LIPA East Garden City Substation is an existing 138 kV AIS substation with a ten (10) position ring bus configuration.The Solution includes the installation of three (3) air core reactors with by-pass circuit, in series, to the 138 kV lines 138-462,138-465, and 138-463, respectively. Due to current site constraints, the new series reactors will be installed in the property adjacent to the existing station

Description of Work: Upgrades to the existing Con Edison Rainey Substation, located in the Borough of Queens, City of New York, Queens County. The Rainey Substation is an existing 345 kV AIS substation configured with a six (6) line position ring bus tied with an eight (8) line position ring bus in the same yard. The Solution includes the addition of two new breakers in series with the existing 345 kV CB -1E and CB-6E respectively, providing an additional contingency level.

Description of Work: Upgrade to the 345 kV East Garden City Substation, to be located at 555 Stewart Avenue, Hamlet of Uniondale, Town of Hempstead, Nassau County. The New 345 kV East Garden City Substation will be connected by four (4) new 345 kV underground transmission lines and the existing Y-49 Line. Also, it will serve the two (2) existing 345 kV/138 kV transformers located in the existing LIPA 138 kV East Garden City Substation

Description of Work: Interconnection Facilities to the existing LIPA Syosset Substation, located in the Hamlet of Syosset, Town of Oyster Bay, Nassau County. Syosset Substation is a 138 kV AIS substation with an eight (8) ring bus configuration. The Solution includes the installation of a new underground 138 kV line with a PAR in an existing spare line position.

Description of Work: Upgrades to the existing LIPA Oakwood Substation, located in the Hamlet of West Hills in the Town of Huntington in Suffolk County. Oakwood Substation is a 138 KV AIS substation with a 2-bus configuration with a tie breaker. The proposed Solution will re-classify the existing Greenlawn feeder pothead stand and connection as the second leg of the upgraded 2-cable circuit configuration from Oakwood to Syosset circuit and connect the re-classified Oakwood to Syosset second leg to the station via installation of a PASS circuit breaker. The Solution will also remove the existing aerial to underground connection for the existing Greenlawn to Syosset circuit, then install a new Greenlawn to Syosset Transition underground to overhead connection at an alternate location adjacent to the station. The additional circuit to be installed will connect to this revised connection point

Description of Work: I Upgrades to the existing LIPA Syosset Transition Station, located near Woodbury Road in the Hamlet of Woodbury in the Town of Oyster Bay in Nassau County. Syosset Transition Station is a 138 KV underground to overhead transition station with two (2) transition pothead stands.

Description of Work: The proposed 345 kV electric underground transmission line extending from the Barrett Substation in the Hamlet of Oceanside in the Town of Hempstead in Nassau County to the Tremont Substation in the Bronx, New York City, Bronx County with a connection point at the East Garden City Substation in the Hamlet of Uniondale in the Town of Hempstead, Nassau County. The proposed route will be approximately 32.3 miles, utilizing 4000 kcmil cross-linked polyethylene (“XLPE”)cable for the onshore portions of the route and 5000 kcmil cable in a marine crossing by Horizontal Directional Drill (“HDD”) or equivalent trenchless technique.

Barrett to EGC section is 8.76 miles

Description of Work: reconductoring/conversion of an existing LIPA 138 kV circuit between the East Garden City Substation in the Hamlet of Uniondale in the Town of Hempstead in Nassau County, to the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County, via the Newbridge Road Substation in the Hamlet of East Meadow in the Town of Hempstead in Nassau County. A new 0.6 mile 345 kV line will be spliced to the existing line, creating a continuous 345 kV feed between the substations. The routing would be the existing underground routing using the LIPA-owned transmission corridors.

Description of Work: The proposed 345 kV and 138 kV electric underground transmission lines extending from the East Garden City Substation in the Hamlet of Uniondale in the Town of Hempstead in Nassau County to the Shore Road Substation in the Glenwood Landing Hamlet in Nassau County. The proposed route will be approximately 10.3 miles, utilizing 4000 kcmil XLPE cable for the route.

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

Ruland Road to Shore Road segment is 17.82 miles

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

New Rochelle Landing to New Rochelle Station segment is 1.66 miles

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

Ruland Road to Shore Road segment is 17.82 miles

Description of Work: The proposed 138 kV electric underground transmission line begins at the Syosset Substation in the Hamlet of Woodbury in the Town of Oyster Bay in Nassau County leading to the Shore Road Substation in the Hamlet of Glenwood Landing in the Town of Oyster Bay in Nassau County. The proposed route will be approximately 11.3 miles, utilizing 4000 kcmil XLPE cable

Propel NY - TO51 AS5	
ESTIMATE ASSUMPTIONS & CLARIFICATIONS	
General assumptions/clarifications	
1	This TO51 estimating workbook includes the substation and transmission line components listed in the sheet.
2	Based on 2022 pricing
3	The estimate contains 20% contingency amount. To cover unknow risk allowance. Costs include contractor mark-up (6%-trunkey cost (i.e. HVDC, GIS), 18%-others) for OH and profit
4	Costs have been developed based on historical data from Projects of a similar nature (AACE Class 5 and 4 Estimating Practices). Major equipment pricing is based on budgetary quotes from equipment suppliers. However, we have not engaged any subcontractors or material venders for formal quotes for minor materials.
5	Cost for dust control is excluded, we assume that water trucks for construction are not required.
6	Excavation currently excludes rock. More detail required to quantify rock, as well as construction means and methods allowed. Rock adder is approximately \$405/CY for standard rock excavation.
7	Work schedule assumes working 5 days per week, 10 hours per day. The construction durations for each segment are based on Attachment B.04.1 Addendum Construction Schedule Revision 0.
8	Pricing assumes union labor will be required.
9	In indirect section, we assume that these construction contracts will be let on an EPC type basis (perhaps progressive design-build or similar contracting model) and that the construction contractor would have significant input into the pre-con planning stage. The project management staffing make up is based on the project scope and duration, for the substation interconnection/upgrade project (expect East Garden City station) only assume one construction manager and one environmental coordinator to meet EMCP requirement.
10	Cost s will vary for handling and disposal of contaminated spoils, depending on type of contaminants and availability / location of the appropriate tippy facility. Since there is not enough information to provide a quantified estimate for this item, allowance is included in the contingency monies.
11	An allowance of 5% for transmission design and engineering is included in indirect section, cost of turnkey GIS and HVDC excluded
12	An allowance of 8% for substation design and engineering is included in indirect section, cost of turnkey GIS and HVDC excluded
13	An allowance of 0.3% for GPR of the transmission line is included in indirect section
14	An allowance of 0.7% for survey and staking of the tline and substation layout is included in indirect section, cost of turnkey GIS and HVDC excluded for substations.
15	An allowance of 3.75% for substation testing and commissioning is included in indirect section, cost of turnkey GIS and HVDC excluded
16	An allowance of \$20,000 per circuit for transmission line testing and commissioning is included in indirect section
17	An allowance of 1% for environmental Licensing & Permitting Costs & related legal cost is included in indirect section; and cost for environmental-special studies/investigation is quantified and included for required segment. Cost of turnkey GIS and HVDC excluded for substations.
18	The estimate does not include cost for insurance, assume it will be provided by he owner (i.e. OCIP) . The estimate includes cost for bond (2% of the total contract value)
19	New York State sales tax of 8.8% is included for all material pricing
20	A mob of 3% and demob of 2% has been included per segment (percentage is based on construction labor and equipment costs), except submarine segment.
21	An allowance of 1% for Preconstruction Supervision (Engineering, Permitting, Procurement) is included in indirect section.
22	An allowance of 4% for Project Management & Staffing (includes PM, Field Engineers / Supervision, Scheduler and Cost Manager, SHEQ Staff, and Admin Staff) is included in indirect section.
23	An allowance of 1% for Utility PM and Project Oversight is included in indirect section.
24	An allowance of 1% for Site Accommodation, Facilities, Storage is included in indirect section.
25	An allowance of 3% of the real estate acquisition cost is included for real estate legal fees.
Tline assumptions/clarifications	
21	Assumed all UG conduits are installed with concrete encasement and no splicing point included inside substations. The conduit trench details please refer to each tab.
22	Not enough detail to quantify existing utility relocation. A plug of \$1M per mile has been included for relocation of existing utilities and \$200K / mile for protection of existing utilities.
23	Traffic control allows for k-rail, metal sheet plates and lane control for underground sections. We have not included for construction of new roads or any permanent traffic measures.
24	The trench excavation width and depth assumed details are shown in each tab.
25	The MH counts are based on our field and desktop review
26	Assumes that 30% of native spoils from vault excavation will be used as backfill.
27	Off haul / disposal spoils quantity includes a 1.3X multiplier for truck load.
28	Assumed asphalt paving repair includes a 2" surfacing course pavement
29	Additional 5% of route length is added to UG cable length, 10% of route length added to submarine cable length
30	All Tline segments construction period is based on the provided milestone schedule.
31	Shore Road to Sprainbrook 345kv UG line, assume Shore Road to New Rochelle is 4-circuit, New Rochelle to Sprainbrook is 2 -circuit.
32	The submarine cable quantity and cost are calculated based on # of passes and the total cable length. We assume i.e 1 circuits, 2 cable per circuit, so there are 2 passes.
33	For transmission lines that are routed on the west side of the LI Sound (Bronx and Westchester County) assume 40% rock excavation.
Substation assumptions/clarifications	
33	Site grading: Excavation quantity in substations is based on 3', fill quantity is based on 60% site borrow and 40% import.
34	Substation new access road access road quantity is based on interior access road only, no new exterior access roads are required based on the plot drawings provided.
35	Substation pad is based on 8" base and 6" surfacing rock.
36	The firewalls for transformers/PAR/Reactors are assumed 30' tall, if required
37	All of the enclosure buildings are based on dimensions shown on the site plot plan, cost includes pre-engineered building structure, HVAC, mechanical, fire protection.
38	Costs for precast concrete piles (12"x80') were included in several substations by developer, there are no drawings nor geo technical report to verify if it is required and the quantities. We assumed it is required and included the costs based on developer's quantities.
39	The control panels quantities and values are provided by Sub Station Engineers.

Description of Work: New, greenfield substation to be called “New Rochelle Substation,” which would be 345 kV and located near 60 Echo Avenue in the City of New Rochelle, Westchester County. The substation would allow for the transition of electric submarine transmission cables to electric underground transmission cables at a location outside of the shoreline of Long Island Sound.

Description of Work: New greenfield 345 kV Shore Road Substation, to be located at 375 Shore Road, in the Hamlet of Glenwood Landing, Town of Oyster Bay, Nassau County. The 345 kV Shore Road Substation will serve as the transition station. A new 345 kV underground terrestrial transmission line will be converted into two (2) marine transmission lines for crossing Long Island Sound. Also, a 345 kV shunt reactor will be installed for compensation.

Description of Work: New greenfield 345 kV/138 kV Ruland Road Substation, to be located on Ruland Road in the Hamlet of Melville, Town of Huntington, Suffolk County. The New substation will consist of a 138 kV air insulated switchgear (“AIS”) five (5) position ring bus substation and a 345 kV AIS four (4) position ring bus substation interconnected by three (3) 345 kV/138 kV power transformers.

Description of Work: new 345/ 138 kV GIS substation in Eastern Queens at a vacant utility owned property in the area of 180th Street and Brinkerhoff Avenue. The configuration of the station would include an eight position 345 kV GIS ring bus which will allow for interconnection of the 3 underground circuits from Barrett Substation and the two circuits that connect to Tremont and Dunwoodie Substations. In addition, there will be 3 – 345/138kV autotransformers that connect to the 345 kV bus. Two of the autotransformers will feed a new 138 kV four breaker ring bus that will interconnect to the 901 and 903 circuits that will connect to Jamaica Substation. Each of the feeders that interconnect to Jamaica will be PAR controlled. The third autotransformer, with 138 kV PAR will feed a sperate new 138 kV four breaker ring bus that will interconnect with the 901 and 903 circuits that will connect to Valley Stream and Lake Success Substations. The existing PARs at Lake Success and Valley Stream will be removed. In addition, that ring bus will include a 138kV oil-filled shunt reactor.

Description of Work: new greenfield 345 kV Barrett Substation, to be located near 4005 Daly Boulevard, in the Hamlet of Oceanside, Town of Hempstead, Nassau County. The New 345 kV Barrett Substation will serve as the main Point of Interconnection (“POI”)between the generation and transmission operator. The New substation will step up the 138 kV POI voltage to 345 kV, and a new 345 kV underground line will be connected

Description of Work: new +/- 320 kV 1250 MW HVDC voltage source converter station. The station will be location on property adjacent to the Sprain Brook Substation.The HVDC converter station output will interconnect via a short overhead or underground line into the additional bay at Sprain Brook that was added as part of The Solution

Description of Work: New 345 kV four (4) breaker ring bus station. The station will have three (3) four (4) 345/ 138 kV autotransformers that will connect into the expanded Northport 138kV that will be required for the OSW developers to build in order to reliably interconnect into the LIPA 138 kV system

Description of Work: The existing Consolidated Edison Company of New York, Inc. (“Con Edison”) Tremont Substation, located in the Borough of the Bronx, New York City, Bronx County. Tremont Substation is an existing 345 kV AIS substation fed by a single underground 345 kV Line, X-28, which is a Con Edison transmission circuit. The X-28 circuit is connected to a common rigid bus that feeds two (2) 345 kV / 138 kV transformers in parallel. The Solution consists of the termination of a new 345 kV circuit, which requires installing a new 345 kV GIS six-position ring bus within the existing fence-line of the substation.

Description of Work: Interconnection Facilities to the existing Con Edison Sprain Brook Substation, located in the City of Yonkers, Westchester County. Sprain Brook Substation is an existing 345 kV AIS substation with a breaker and a half (“BAAH”) configuration. The solution includes installing a new underground 345 kV line with a shunt reactor in new bay position and a second 345 kV underground interconnection with the adjacent HVDC converter station

Description of Work: Upgrades and Potential Interconnection Facilities to the existing LIPA Ruland Road Substation, located in the Hamlet of Melville, Town of Huntington, Suffolk County. Ruland Road Substation is an existing 138 kV AIS substation configured with six (6) BAAH bays. The Solution includes installing three (3) air core reactors in series to the 138 kV Lines 138-561,138-562, and 138-567, respectively, which are proposed as Upgrades and two (2) 138 kV circuit breakers which are proposed as Potential Interconnection Facilities.

Description of Work: Interconnection Facilities to the existing LIPA Shore Road Substation, located in the Hamlet of Glenwood Landing, Town of Oyster Bay, Nassau County. Shore Road Substation is an existing 138 kV AIS substation with a main-tie main configuration. The Solution includes installing two (2) additional circuit breakers to create a six (6) position ring bus configuration.

Description of Work: Interconnection Facilities to the existing LIPA Syosset Substation, located in the Hamlet of Syosset, Town of Oyster Bay, Nassau County. Syosset Substation is a 138 kV AIS substation with an eight (8) ring bus configuration. The Solution includes the installation of a new underground 138 kV line with a PAR in an existing spare line position.

Description of Work: interconnection facilities to the existing ConEd Dunwoodie Substation, located in the City of Yonkers, Westchester County. The Dunwoodie Substation includes an existing 345 kV GIS six (6) breaker ring. It is proposed that an additional braker be added to the ring to allow for interconnection of the new underground line from the Eastern Queens substation.

Description of Work:The Applicants propose Upgrades to the Holbrook Substation, which is an existing LIPA 138 kV AIS substation, configured as an eight (8) position ring bus. The Holbrook Substation is located in the Hamlet of Holbrook in the Town of Brookhaven in Suffolk County.The 138 kV, 138-882 Line currently feeds two (2) 138 kV/69 kV transformers via an AIS disconnect before connecting into its bus section within the ring bus. The Solution involves replacing the existing switch #1322 with a new hybrid PASS GIS 138 kV breaker system with integrated disconnect and ground switches.

Description of Work: Upgrades to the existing LIPA Barrett Substation, located in the Hamlet of Oceanside, Town of Hempstead, Nassau County. Barrett Substation is an existing 138 kV AIS substation with a main-tie-main configuration.The Solution includes the addition of a new breaker in series with the existing 138 kV CB-1330 currently feeding a 138 kV/69 kV transformer bank

Description of Work: Upgrades to the existing LIPA East Garden City Substation, Hamlet of Uniondale, Town of Hempstead, Nassau County. The LIPA East Garden City Substation is an existing 138 kV AIS substation with a ten (10) position ring bus configuration.The Solution includes the installation of three (3) air core reactors with by-pass circuit, in series, to the 138 kV lines 138-462,138-465, and 138-463, respectively. Due to current site constraints, the new series reactors will be installed in the property adjacent to the existing station

Description of Work:Upgrades to the existing LIPA Lake Success Substation, located in the Hamlet of North New Hyde Park, Town of North Hempstead, Nassau County. Lake Success Substation is an existing 138 kV AIS substation with a main-tie-main configuration.The Solution includes replacing removal of the existing Jamaica 903 Line 138 kV PAR and installation of a new, higher capacity PAR and installing a oil-filled shunt reactor

Description of Work: Upgrades to the existing Con Edison Rainey Substation, located in the Borough of Queens, City of New York, Queens County. The Rainey Substation is an existing 345 kV AIS substation configured with a six (6) line position ring bus tied with an eight (8) line position ring bus in the same yard. The Solution includes the addition of a new breaker in series with the existing 345 kV CB -1E, providing an additional contingency level.

Description of Work: 345 kV electric underground transmission line extending from the Barrett Substation in the Hamlet of Oceanside in the Town of Hempstead in Nassau County to the Tremont Substation in the Bronx, New York City, Bronx County. The proposed route will be approximately 25.7 miles, utilizing 4000kcmil XLPE cable for the onshore portions of the route and 5000kcmil cable in a marine crossing by Horizontal Directional Drill (“HDD”) or equivalent trenchless technique. Please see the Design Basis Manual, Attachment B.1.1, for more details. Three counties, one city, one town, and three villages will be traversed between the two substations. The proposed route starts in the Hamlet of Oceanside in the Town of Hempstead in Nassau County traveling north through the Villages of Rockville Centre and Lynbrook. The proposed route travels through into the Village of Valley Stream before entering the Borough of Queens, City of New York, Queens County. The proposed route passes a vacant property in the area of 180th Street and Brinkerhoff Avenue, which may allow for future expansion, such as the 6,000MW expansion. In this Solution the Y-51 circuit will be interconnected into the new Eastern Queens Substation. The proposed route will exit Queens County into the Borough of the Bronx, City of New York, Bronx County as it crosses the East River. Once in Bronx County, the proposed route will travel north and west to terminate at Tremont Substation

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

Ruland Road to Shore Road segment is 17.82 miles

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

Shore Road to New Rochelle segment is 10.22 miles, Submarine segment is 8.63 miles (included the HDD section).

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

New Rochelle Station To Sprainbrook segment is 8.14 miles

Description of Work: T double circuit 345 kV electric underground transmission lines will extend from the Barrett Substation in the Hamlet of Oceanside in the Town of Hempstead in Nassau County to the Eastern Queens Substation in the Borough of Queens, New York City, Queens County. The proposed 345 kV electric underground transmission line will terminate at the Dunwoodie Substation in the City of Yonkers, Westchester County. The proposed route will be approximately 32 miles, utilizing 4000kcmil XLPE cable for the onshore portions and 5000kcmil cable for a marine crossing via Horizontal Directional Drill (HDD) or equivalent trenchless technique. Between the three substations, the proposed route crosses through three villages, one town, one city, and three counties.The segment from Barrett to Eastern Queens is 11 miles

Description of Work: The proposed 345 kV electric underground transmission lines extending from the Ruland Road Substation in the Hamlet of Melville in the Town of Huntington in Suffolk County to the Sprain Brook Substation in the City of Yonkers, Westchester County. A marine segment is proposed from Shore Road Substation to a landing point in New Rochelle across the Long Island Sound. The proposed route will be approximately 36.1 miles, utilizing 4000 kcmil XLPE cable for the onshore portions of the route and two circuits of 3x1400 mm2 (2760 kcmil) Cu/XLPE/Pb/StSWA submarine cable for the offshore portions of the route.

Ruland Road to Shore Road segment is 17.82 miles

Description of Work: The 901 circuit from the point of interception will require an approximate 0.5 double circuit 138 kV construction utilizing 4000kcmil XLPE cable. At the point of intercept for the portion of the 901 cable going to Jamaica an oil stop transition joint will be utilized. Due to the fact that the portion of the 901 cable towards Valley Stream will be limiting it is proposed that that 6 mile portion of the cable will be upgraded using 4000kcmil XLPE cable.

Description of Work: The 903 circuit from the point of interception will require an approximate 2.5 mile double circuit 138 kV construction utilizing 4000kcmil XLPE cable. At the point of interception oil stop transition joints are proposed to connect to the existing cables.

Description of Work: . It is currently anticipated that a similar route from the point of intercept to Valley Stream Substation would be utilized and would interconnect at the location of the existing 901 circuit. The portion of the existing 901 cable from the point of intercept to the Valley Stream Substation would likely be retired.

Propel NY - TO53 AS7	
ESTIMATE ASSUMPTIONS & CLARIFICATIONS	
General assumptions/clarifications	
1	This TO52 estimating workbook includes the substation and transmission line components listed in the sheet.
2	Based on 2022 pricing
3	The estimate contains 20% contingency amount. To cover unknow risk allowance. Costs include contractor mark-up (6%-trunkey cost (i.e. HVDC, GIS), 18%-others) for OH and profit
4	Costs have been developed based on historical data from Projects of a similar nature (AACE Class 5 and 4 Estimating Practices). Major equipment pricing is based on budgetary quotes from equipment suppliers. However, we have not engaged any subcontractors or material venders for formal quotes for minor materials.
5	Cost for dust control is excluded, we assume that water trucks for construction are not required.
6	Excavation currently excludes rock. More detail required to quantify rock, as well as construction means and methods allowed. Rock adder is approximately \$405/CY for standard rock excavation.
7	Work schedule assumes working 5 days per week, 10 hours per day. The construction durations for each segment are based on Attachment B.04.1_Addendum Construction Schedule Revision 0.
8	Pricing assumes union labor will be required.
9	In indirect section, we assume that these construction contracts will be let on an EPC type basis (perhaps progressive design-build or similar contracting model) and that the construction contractor would have significant input into the pre-con planning stage. The project management staffing make up is based on the project scope and duration, for the substation interconnection/upgrade project only assume one construction manager and one environmental coordinator to meet EMCP requirement.
10	Costs will vary for handling and disposal of contaminated spoils, depending on type of contaminants and availability / location of the appropriate tippy facility. Since there is not enough information to provide a quantified estimate for this item, allowance is included in the contingency monies.
11	An allowance of 5% for transmission design and engineering is included in indirect section, cost of turnkey GIS and HVDC excluded
12	An allowance of 8% for substation design and engineering is included in indirect section, cost of turnkey GIS and HVDC excluded
13	An allowance of 0.3% for GPR of the transmission line is included in indirect section
14	An allowance of 0.7% for survey and staking of the tline and substation layout is included in indirect section, cost of turnkey GIS and HVDC excluded for substations.
15	An allowance of 3.75% for substation testing and commissioning is included in indirect section, cost of turnkey GIS and HVDC excluded
16	An allowance of \$20,000 per circuit for transmission line testing and commissioning is included in indirect section
17	An allowance of 1% for environmental Licensing & Permitting Costs & related legal cost is included in indirect section; and cost for environmental-special studies/investigation is quantified and included for required segment. Cost of turnkey GIS and HVDC excluded for substations.
18	The estimate does not include cost for insurance, assume it will be provided by he owner (i.e. OCIP) . The estimate includes cost for bond (2% of the total contract value)
19	New York State sales tax of 8.8% is included for all material pricing
20	A mob of 3% and demob of 2% has been included per segment (percentage is based on construction labor and equipment costs), except submarine segment.
21	An allowance of 1% for Preconstruction Supervision (Engineering, Permitting, Procurement) is included in indirect section.
22	An allowance of 4% for Project Management & Staffing (includes PM, Field Engineers / Supervision, Scheduler and Cost Manager, SHEQ Staff, and Admin Staff) is included in indirect section.
23	An allowance of 1% for Utility PM and Project Oversight is included in indirect section.
24	An allowance of 1% for Site Accommodation, Facilities, Storage is included in indirect section.
25	An allowance of 3% of the real estate acquisition cost is included for real estate legal fees.
Tline assumptions/clarifications	
26	Assumed all UG conduits are installed with concrete encasement and no splicing point included inside substations. The conduit trench details please refer to each tab.
27	Not enough detail to quantify existing utility relocation. A plug of \$1M per mile has been included for relocation of existing utilities and \$200K / mile for protection of existing utilities.
28	Traffic control allows for k-rail, metal sheet plates and lane control for underground sections. We have not included for construction of new roads or any permanent traffic measures.
29	The trench excavation width and depth assumed details are shown in each tab.
30	The MH counts are based on our field and desktop review
31	Assumes that 30% of native spoils from vault excavation will be used as backfill.
32	Off haul / disposal spoils quantity includes a 1.3X multiplier for truck load.
33	Assumed asphalt paving repair includes a 2" surfacing course pavement
34	Additional 5% of route length is added to UG cable length, 10% of route length added to submarine cable length
35	All Tline segments construction period is based on milestone schedule provided.
36	No schedule provided for 901 & 903 intercept, 901 EQ to VS 138kv UG, assume 2.5/10/13 months construction
37	901/903 intercept to Eastern Queens 138 kV lines, we assumed the transition splice vaults as regular vaults.
38	Shore Road to Sprainbrook 345kv UG line, Shore Road to New Rochelle is 2-circuit, New Rochelle to Sprainbrook is 1 -circuit.
39	The length from New Rochelle Landing to New Rochelle (0.86mi) was added to the developer length on AS 7.7b (NR landing - Sprainbrook 320kv DC). Assume the 320KV DC mh size same as 345kv.
40	The submarine cable quantity and cost are calculated based on # of passes and the total cable length. We assume i.e 1 circuits, 2 cable per circuit, so there are 2 passes.
41	For transmission lines that are routed on the west side of the LI Sound (Bronx and Westchester County) assume 40% rock excavation.
Substation assumptions/clarifications	
42	Site grading: Excavation quantity in substations is based on 3', fill quantity is based on 60% site borrow and 40% import.
43	Substation new access road access road quantity is based on interior access road only, no new exterior access roads are required based on the plot drawings provided.
44	Substation pad is based on 8" base and 6" surfacing rock.
45	The firewalls for transformers/PAR/Reactors are assumed 30' tall, if required
46	All of the enclosure buildings are based on dimensions shown on the site plot plan, cost includes pre-engineered building structure, HVAC, mechanical, fire protection.
47	Each substation construction period is based on milestone schedule provided
48	Costs for precast concrete piles (12"x80') were included in several substations by developer, there are no drawings nor geo technical report to verify if it is required and the quantities. We assumed it is required and included the costs based on developer's quantities.
49	The control panels quantities and values are provided by Sub Station Engineers.
50	Assumes that GIS Tech Rep pricing will be included with GIS equipment supply price.

Project:	All
Developer:	All
Project Name:	All

Item #	Risk Title	Description	Comments
Environmental and Permit Concerns			
E-1	Article VII Certificate	Article VII approval process could take longer than estimated in schedule for a variety of reasons (<i>i.e.</i> , additional special studies requested by involved agencies, lack of stakeholder consensus).	Developer needs early outreach with all stakeholders and to prepare a comprehensive application. Developer's experience with Article VII process will be essential.
E-2	Other environmental approvals	Federal agency and other approvals could take longer than the state Article VII process.	Developer needs early outreach with federal agencies and others to prepare comprehensive applications and obtain approvals in parallel with the Article VII process. Could take up to 5 months if Developer files for Evidentiary Hearing.
E-3	Public Opposition	If local groups or citizens oppose the project, it could cause significant delays especially if opposition results in litigation.	Developer needs early outreach to solicit public involvement, incorporate public concerns during planning stage before project execution, build mitigation into design, and foster community buy-in.
E-4	EM&CP Approval	EM&CP approval process could take longer than estimated by the Developer in schedule.	Developer needs to prepare a comprehensive EM&CP that will meet regulatory agency requirements. Developer's experience with DPS, DEC, Ag. & Markets, and other agency requirements will be essential.
E-5	Environmental Study Findings	Environmental studies could find critical habitat, wetlands, agricultural lands, rare, threatened or endangered species, cultural or archeological sites, etc. that could require re-routing of lines or special conditions, such as seasonal restriction on construction. The time of year when studies can be conducted could also affect project schedule.	Studies need to be scheduled and conducted early in the process to ensure design and the EM&CP adequately minimizes, mitigates, or avoids environmental impacts.
E-6	Construction Approval Restrictions- Long Island Sound Crossing	Time of year restrictions will likely be imposed. The Army Corps of Engineers will likely not allow work from Jan 1 – May 31 as a condition of their Nationwide Permit. Further, based on experience in Region 1 tidal waters, NYSDEC imposes a no-work window from Jan 1 – Sept 30. These combined restrictions would result in an allowable work window of Oct 1 – Dec 31.	
E-7	Environmental Study Findings- NYSDEC Wetland and Adjacent Areas- Barrett	The wetlands and/or the 300' Tidal Wetland Adjacent Area at Barrett Substation are likely unavoidable by any project looking to construct in this area.	Mitigation in the form of restoration is anticipated to be required.
E-8	Unknown environmental conditions discovered during construction	During construction, the Developer could encounter previously unidentified issues, such as contaminated soil, archeological remains, rare, threatened or endangered species, unidentified utilities, etc.	Environmental monitor will be on-site during construction. Such findings could require relocating and/or redesigning structures resulting in construction delays.
E-9	Violation of env. requirements during construction	Construction activities could result in violations of environmental permits/approvals due to inadequate control measures or not following plans (<i>i.e.</i> , storm water discharges) resulting in stop work notice.	The risk can be mitigated by following Best Management Practices and ensure crews are adequately trained to implement EM&CP and other environmental permit/approval requirements.

Item #	Risk Title	Description	Comments
Property, Routes and Siting Concerns			
P-1	Gas pipeline mitigation	Transmission line crossings and paralleling of natural gas pipelines may require grounding or other mitigation, and natural gas pipeline entities are increasingly aware of this issue and demanding mitigation to be installed by transmission utilities.	The cost of gas pipeline mitigation studies and mitigation requirements are relatively small compared to the overall project cost. The risk can be mitigated by a study to determine the exact location of gas pipeline(s) and recommend mitigation requirements.
P-2	Transmission line crossings	Crossing of other transmission and distribution lines: creates additional schedule risk, to the extent an outage needs to be scheduled; creates additional operating risk, to the extent a single event could remove both elements from services; and creates cost risk to the extent unexpected costs such as raising, lowering, or relocating an existing line is required.	This risk is mitigated by early identification of all necessary crossings. For example, this risk is best minimized during construction through frequent coordination with the existing transmission line owner and installation of protective netting and other protection prior to pulling sock line and conductor. This risk can be mitigated through the development of High Risk Evolution Plans for transmission crossings, which include, at a minimum, coordination with all involved utility owners, contractors, construction and project management planning sessions and a detailed schedule of events for crossing.
P-3	Highway, Railroad Crossings, Navigable Waterway crossings	Crossing of Highways, Railroads, and Navigable Waterways creates additional risk to the project schedule and cost, depending on the requirements imposed during construction.	The risks can be mitigated by early identification of all necessary crossings. Prior to and during construction this risk is best minimized through frequent coordination with those responsible for the operation of the facilities being crossed. Develop High Risk Evolution Plans for all major highway, RR or waterway crossings which include at a minimum coordination with RR, flaggers, contractors, Local and state police / highway patrol, US Coast Guard, construction and project management planning sessions and a detailed schedule of events for crossing.
P-4	Discovery of buried utilities and other encumbrances or poor soil conditions in planned routes of underground cables	May require relocation of existing facilities and/or rerouting of new circuit.	
P-5	Additional cable vaults	Additional cable vaults might be required due to turning angle, major crossings (e.g., roadway, aqua duct, utilities, railroad).	GPR study, test pits, and engineering review.
P-6	Routing Concern- Significant Route Changes	During the Article VII process there is a risk that the final approved route may have material differences than the proposed route.	
P-7	Property Acquisitions Concern- ROW Easements and Access	Private ROW and land acquisition or public ROW Use or Consent Agreements can result in changes to route alignment, requiring additional environmental surveys, permit amendments, and construction start delay.	The risk can be mitigated by instituting early outreach with landowners and develop route refinement tracking process so that all project SMEs review potential changes.

Item #	Risk Title	Description	Comments
Construction and Operational Concerns			
C-1	Supply Chain Issues	Material and equipment shortages and delayed shipments.	The risks can be mitigated by proper quality assurance during engineering to insure adequate quantities ordered. Procurement with sufficient period of float between scheduled deliveries from suppliers and when material is needed for construction and proactive monitoring and expediting.
C-2	Operational issues	Need to maintain resources for emergency response for the life of the facility.	This risk can be mitigated by maintaining a local staff, contracting with emergency restoration provider in the project area, and entering into mutual assistance agreements with neighboring utilities.
C-3	Need for additional Network Upgrade Facilities	Detailed studies, such as fault studies and protection coordination for the project, will normally be completed during the System Impact Study, the Facilities Study, and detailed engineering.	The new facilities and Upgrades proposed by the Developers as a part of its project may require replacement of breakers, protection equipment etc to connect reliably to the existing system.
C-4	Catastrophic HSE / Safety Event	High-voltage transmission and substation work is inherently dangerous. Accidents that occur on projects of this nature frequently result in serious injury or fatality. Catastrophic safety events, such as loss of life, can result in extended work stoppages across all stages of the project.	This risk can be mitigated through a robust Project and Site Safety Program implementation. Project Orientations verify training of ALL project personnel. Extensive Health, Safety and Environmental (HSE) management presence during construction helps to ensure compliance.
C-5	Construction Quality Control	Compliance with project specifications and quality can be compromised if installations are not properly monitored. Structure misalignments, improper structure framing, use of incorrect materials, etc. can result in re-work, unnecessary delays, and project overruns. Larger and complex projects that require greater resources are more susceptible to Quality Control Issues. If the NYPSC cited a contractor as being in non-compliance, the result can be extended work stoppages.	This risk can be mitigated by detailed Quality Control/Quality Assurance Plans during early planning stages and in a detailed Project Execution Plan; ensuring inspection processes are in place for all components of construction; and considering the utilization of third-party inspectors to ensure compliance.
C-6	Change Order Management - Construction Impacts	Unresolved Change Orders may result in delays to construction and impact the schedule.	This risk can be mitigated by including detailed Change Order Management Plan and process in the Project Execution Plan in order to mitigate potential delays.
C-7	Night time work	All projects have transmission routes through heavily trafficked areas and intersections with underground/overhead utilities.	Doing work during nighttime hours will mitigate this risk.
C-8	Material, fuel price	Current material and fuel escalation rate is unpredictable and could fluctuate greatly over next few years.	Establish a contingency budget to cover the increase.
C-9	Labor shortage	Labor resource to perform the construction activities and availability of qualified supervision.	Early engagement with local unions, establish bonus incentives, retainage, hiring bonuses, etc.
C-10	Work in commercial & residential area	Work hours might be restricted in the commercial and residential areas.	Early engagement and communication with communities and local authorities by PR and permitting SMEs. Divide project into segments and work in multiple segments concurrently to mitigate the overall project schedule impact.
C-11	Bridge/overpass clearance	Low clearance for bridges/overpasses may hinder transport of high-profile equipment.	Verify clearances of all bridges/overpasses prior to construction and confirm appropriate routes for high-profile equipment.
C-12	Submarine Cable Vessel Availability	Submarine cable installation utilizes specialized cable laying vessels. There are only a limited number of these vessels worldwide—some of the vessels are owned by individual cable manufacturers. Availability may be limited.	This can be mitigated by early coordination and contracting with vessel suppliers (e.g., target 2 years in advance).

Item #	Risk Title	Description	Comments
C-13	Construction Concern- Space for Trenchless Equipment	There are several crossings for all projects that require Jack and Bore or Horizontal Directional Drilling. Implementing these crossing can be challenging due to the amount of construction space required and being in close proximity to other utilities. Modifications to proposed routes may be necessary to accommodate the construction equipment.

Item #	Risk Title	Description	Probability	Cost Impact	Schedule Impact	Comments
--------	------------	-------------	-------------	-------------	-----------------	----------

Environmental and Permit Concerns						
E-1	Cable and Pipeline Crossing	The waters surrounding Long Island and New York City contain a large number of existing submarine linear infrastructure, including electric/telecommunication cables and pipelines. Crossing of linear infrastructure will likely require approvals from the asset owner. Failure to receive permission to cross existing linear infrastructure could result in a specific submarine route not being feasible.	L	L	L	This project has 1 cable and 1 pipeline crossing. Existing infrastructure, including pipelines, communications, and electric cables, would require authorization from the owners to cross. Most approvals would likely be part of the Article VII process, but any Connecticut or Federal approvals would be separate. LS Power's proposed alternate route avoids crossing into Connecticut's jurisdiction.
E-2	Navigation Channels and Anchorages- Lower Risk	The waters surrounding Long Island and New York City contain a large number designated channels and anchorage. Therefore, routing through this area is very complex and will cross multiple navigation features. ▪ Implications: This work will need to be completed in a manner that does not impact navigation in the busy New York port. This is likely to include HDD across high traffic areas. A USACE Section 408 permit will be required and if numerous and/or large lengths of channels/anchorages are crossed this could be a lengthy process. Additionally, crossing anchorages and channels requires increased burial depth. Current guidance from USACE is 15 feet below authorized depth or the actual maintained depth, whatever is deeper. Furthermore, if areas of high contamination are crossed, regulatory agencies could require alternate cable burial methods which could be more time consuming and costly (i.e., mechanical dredging with an environmental bucket and backfilling with clean fill).	L	L	L	This project crosses 1 navigation area and 1 anchorage area. Crossing of Navigation Channels and Anchorage Areas would require authorization from the USACE under Section 408. The USACE may require low-impact crossing methods, such as HDD, or may deny the authorization outright.
E-3	Connecticut Permitting	A portion of the transmission route across the Long Island Sound is in close proximity to the Connecticut state boundary near the landing at Port Chester. It is recommended that the project be designed to stay within the boundaries of New York to avoid additional permitting and authorizations from Connecticut.	L	L	L	LS Power's proposed alternate route avoids crossing into Connecticut's jurisdiction.

Cost to Mitigate Risk	Greater than \$20M	\$11M-20M	\$6-\$10M	Below \$5M
Schedule Impact	More than 6 month	3-6 months	1-3 months	Less than 1 month

Item #	Risk Title	Description	Probability	Cost Impact	Schedule Impact	Comments
Property, Routes and Siting Concerns						
P-1	Routing Concern- Bridge Crossing	Southgate – Northgate Line: May not be able to install cable on King St. at the bridge crossing noted as D7 and D8 (see Attachment C.2A.1 Page 63) due to low clearance (approximately 3') to waterway running between two ponds.	L	M	L	LS Power's proposed Alternate B route avoids this crossing.
P-2	Property Site Concerns- Northgate substation- subsurface condition	Approximately 50% of the site could encounter rock during excavation and the site might require extensive slope protection. Site conditions will require further investigation to quantify. This could have high cost and schedule impact depending on volume of rock excavation and methods used (i.e., blasting likely not allowed in this area)	H	M	L	Independent estimate has assumed that rock excavation is required.
P-3	Property Acquisition Concern- Ruland Road	LIPA is planning to utilize available property at the site. LS Power will need to coordinate with the utility and potentially modify its layout to accommodate the LIPA-planned facility, if needed.	M	M	L	
Design Concerns						
D-1	Design Concern - No spare power cable conduit	Replacement of a failed cable would be more difficult without a spare conduit.	L	L	L	
D-2	Design Concern- Multiple Circuits in Same Duct Bank- Higher Risk More Than 50 miles	All three circuits are installed in the same duct for the Longshore – Southgate and Southgate – Northgate lines. This has the potential risk of two or more circuits being damaged if the duct bank was compromised.	M	M	L	Longshore – Southgate - 3 ckts, 21 miles Southgate – Northgate - 3 ckts, 29 miles
D-3	Design Concern- Barrett	The proposal identifies Barrett as a potential Network Upgrade Facility. The proposal assumed that Barrett will be rebuilt to support Empire Wind II and accommodate three 345kV lines from the proposed Longshore substation. Empire Wind II is connecting into Liotta substation.	M	H	H	
D-4	Design Concern- Potential Flooding or Inundation by Storm Surge	Some proposed substations are located in or near a 100-year or 500-year flood zone and/or have the potential for being inundated by a Category 1 storm. The proposal does not address how the substations will be designed to reduce the potential impact of flooding.	L	L	L	The project has 1 substation potentially impacted with a risk score of 7.5.

Long Island PPTN Project Risk Assessment Register

Date: 04/20/2023

Project:	T035
Developer:	LS Power
Project Name:	Atlantic Gateway

	Very High (VH)	High (H)	Medium (M)	Low (L)
Probability Risk Will Occur	90-100%	50-89%	10-49%	Below 10%
Cost to Mitigate Risk	Greater than \$20M	\$11M-20M	\$6-\$10M	Below \$5M
Schedule Impact	More than 6 month	3-6 months	1-3 months	Less than 1 month

Item #	Risk Title	Description	Probability	Cost Impact	Schedule Impact	Comments
D-5	Design Concern - PARs are not equipped with Bypass Switch	A failure of one of the three 345kV PARs would result in a long-term outage of the impacted 138kV line between Longshore and Barrett. Also, an outage of the line will be required to perform maintenance on the PAR.	M	L	L	
D-6	Design Concern - Shunt Reactors are not equipped with breakers or disconnect switches	Three 345kV Lines between Longshore and Southgate have shunt reactors at each end of the lines. Failure of a shunt reactor will trip the line out of service. Also, an outage of the line will be required to perform maintenance on the shunt reactor.	M	L	L	
D-7	Design Concern- Millwood Cap Bank Yard and ROW Access Drive	The proposed GIS bus for the two Buchanan lines will be crossing the access drive to the capacitor bank yard and the transmission ROW.	M	L	L	The proposed GIS will need to be either elevated to allow vehicles to cross under or placed below ground.
D-8	Design Concern- Millwood Underground Line to Northgate	The proposed underground cable from Millwood to Northgate is being routed around the eastern side of the existing capacitor bank yard. Due to an elevation change and rocky conditions, there is an existing retaining wall along the eastern side of the capacitor bank yard.	M	L	L	The underground cable will need to be routed around the existing retaining wall.
D-9	Design Concern- Ruland Rd.	The two proposed 138kV bay additions at Ruland Rd will interfere with an overhead 138kV strain bus to Banks #2 and #4, an overhead 69kV line running from the 69kV yard to air core reactors located in the 138kV yard and an underground 138kV cable (Line 567).	H	M	L	Modifications to the existing infrastructure is required to allow the construction of the two bay additions.
D-10	Design Concern- Ruland Rd.	The one-line diagram shows that one of the 138kV ties from Southgate to Ruland Rd is going to terminate in the existing line terminal position for the 661 line to Pilgrim and the Pilgrim 661 line is to be relocated to the new bay addition. However, the Plot Plan is showing the underground connection between Southgate to Ruland Rd terminating in the incorrect line terminal position. The existing 661 line exits overhead, not underground. Also, the proposed design does not provide a method for tying the existing OH 661 line into the new bay addition.	H	M	L	The 138kV ties between Ruland Rd and Southgate and the relocation of Line 661 needs to be redesigned.
D-11	Design Concern- Southgate	The west side of the proposed Southgate substation borders a U.S. Post Office. There is a large discharge area of the property that is owned by the U.S. Post Office. The layout will need to be designed around this area.	H	L	L	

Long Island PPTN Project Risk Assessment Register

Date: 04/20/2023

Project:	T035
Developer:	LS Power
Project Name:	Atlantic Gateway

	Very High (VH)	High (H)	Medium (M)	Low (L)
Probability Risk Will Occur	90-100%	50-89%	10-49%	Below 10%
Cost to Mitigate Risk	Greater than \$20M	\$11M-20M	\$6-\$10M	Below \$5M
Schedule Impact	More than 6 month	3-6 months	1-3 months	Less than 1 month

Item #	Risk Title	Description	Probability	Cost Impact	Schedule Impact	Comments
Construction and Operational Concerns						
C-1	Construction Concerns- HVDC Lead-times	Due to high demand and equipment complexities, manufacturer's are quoting lead times up to 4 years. With three units being installed, it would take an additional 6 months for the second unit and another six months for the third unit to be installed, tested, and commissioned.	H	L	H	
C-2	Construction Concern- Millwood - Lines to Buchanan and Pleasant Valley Outage	Pleasant Valley (W80, W81) and Buchanan (W97, W98) lines exit the Millwood substation to a double circuit pole. The proposed design is showing two deadend structures being installed at this location to make the transition from overhead to GIS. This installation will require the outages for both lines for an extended period of time. However, this is not accounted for in the Outage Plan.	H	H	H	
C-3	Construction Concern- Millwood Access Road	Due to the terrain and rock conditions, access to the site will be difficult and the Developer's proposal did not include a design for an access road. The Transmission Owner has stated that they cannot obtain access through their facility.	M	M	L	Based on the property outline shown on the Developer's Plot Plan it appears that they could obtain access from Shingle House Rd. The view from the road shows this to have a steep slope and rocky terrain and it is adjacent to a residential home.
C-4	Construction Concern- Submarine Cable Landing Sites	Construction of the underground cables within a roadway requires approximately 30'-35' width for vehicles and equipment. Fox Island Rd near the submarine cable landing at Port Chester and Shore Rd near the submarine cable landing at Cold Springs Harbor are only 25' wide. Therefore, the entire roadways would be closed down during construction eliminating the only access to homes and businesses.	VH	VH	M	Utilizing the proposed alternate landing locations would mitigate this concern. However, utilizing the alternate route will result in longer transmission lines (4 miles additional terrestrial cables).

Environmental and Permit Concerns															
E-1A	Cable and Pipeline Crossing	The waters surrounding Long Island and New York City contains a large number of existing submarine linear infrastructure, including electric/telecommunication cables and pipelines. Crossing of linear infrastructure will likely require approvals from the asset owner. Failure to receive permission to cross existing linear infrastructure could result in a specific submarine route not being feasible.	L	L	L	X	X	X		X	X				These projects have 1 or 2 cable crossings. Existing infrastructure, including pipelines, communications and electric cables, would require authorization from the owners to cross. Most approvals would likely be part of the Article VII process, but any Federal approvals would be separate.
E-1B	Cable and Pipeline Crossing	See E-1A	M	L	L				X						This project has 4 cable crossings and 3 pipe crossings. Existing infrastructure, including pipelines, communications, and electric cables, would require authorization from the owners to cross. Most approvals would likely be part of the Article VII process, but any Federal approvals would be separate.
E-1C	Hudson River Routing- Cable and Pipeline Crossings: To Buchanan	There are a large number of existing pipelines/cables (i.e., Lower New York Bay Lateral Pipeline, multiple Narrows Cables/Pipeline Areas, Neptune Transmission, Bayonne Energy Center, 3 Cross Hudson Pipelines, and a large number of telecom cables) that must be crossed. • Implications: Owner approval to cross these is likely required. Failure to get owner approval could be a potential no/go for a proposed route. Proper setbacks must be maintained to ensure no impacts to existing infrastructure.	VH	H	VH							X	X	X	These projects have as many as 33 cables and 8 pipeline crossings. Existing infrastructure, including pipelines, communications, and electric cables, would require authorization from the owners to cross. Most approvals would likely be part of the Article VII process, but any New Jersey or Federal approvals would be separate. The lines to Buchanan (T042 and T044) and the lines from Farragut to Sprain brook Landing (T042, T043 and T044) have the potential to cross into New Jersey territory.

Item #	Risk Title	Description	Probability	Cost Impact	Schedule Impact	T036 Core 1	T037 Core 2	T038 Core 3	T039 Core 4	T040 Core 5	T041 Core 6	T042 Core 7	T043 En 1	T044 En 2	Comments
E-2A	Navigation Channels and Anchorages- Higher Risk	Upper NY Harbor is almost entirely covered in designated channels and anchorage. Therefore, routing through this area is very complex and will cross multiple navigation features. • Implications: This work will need to be completed in a manner that does not impact navigation in the busy NY port. This is likely to include HDD across high traffic areas. However, within some areas of Upper NY Bay, HDD can be difficult given limited viable locations for entry/exit pits and laydown areas given these navigation features. A USACE Section 408 permit will be required and if numerous and/or large lengths of channels/anchorages are crossed this could be a lengthy process. <u>Given the large number/length of crossings and potential to impact navigation, permit issuance is not a guarantee.</u> Additionally, crossing anchorages and channels requires increased burial depth. Current guidance from USACE is 15 feet below authorized depth or the actual maintained depth, whatever is deeper. USACE also recently authorized a new NY/NJ Harbor Deepening Study to investigate increasing dredge depths within NY Harbor. Furthermore, if areas of high contamination are crossed, regulatory agencies could require alternate cable burial methods which could be more time consuming and costly (i.e., mechanical dredging with an environmental bucket and backfilling with clean fill).	M	M	M				X			X	X	X	These projects cross as many as 6 navigation channels and 8 anchorage areas. Crossing of Navigation Channels and Anchorage Areas would require authorization from the USACE under Section 408. The USACE may require low-impact crossing methods such as HDD or may deny the authorization outright. Has a potential need for re-routing.
E-2B	Navigation Channels and Anchorages- Lower Risk	See E-2A	L	L	L	X	X	X		X	X				These projects cross 1 anchorage area.
E-3A	Contaminated Sediment- Hudson River from Battery to 200 Miles North.	The seafloor sediments in the areas surrounding Long Island and New York City contain known areas of contamination, as well as areas that are likely to contain contaminated sediments as a result of historic industrial activities and discharges. The bottom disturbance necessary to install a submarine cable into the seafloor has the potential to resuspend these contaminated sediments. Agencies are likely to require avoidance and rerouting around areas of high contamination. This area is considered Federal and NY State Superfund Site as a result of PCB contamination. - Implication: Sediment sampling will be required and if impacts found, mitigation measures or rerouting could be required.	H	M	H				X			X	X	X	Approximate length of Hudson River PCB Superfund crossed: T039 - 19 miles T042 - 41 miles T043 - 59.5 miles T044 - 60 miles Potential risk of not getting approval.

E-4	Expansion into East River- New Farragut Substation	NYC Department of Small Business Services is the agency that issues permits for improvement and maintenance to waterfront structures and NYC owned waterfront buildings. The proposed expansion into the East River appears to be in a mapped V-Zone based on the NYC Preliminary Flood Insurance Rate Maps. Pursuant to G304.2 V-Zone Construction Standards Section 6, (NYC, 2022) Development, including land-disturbing activities, seaward of the reach of mean high tide are prohibited. Therefore, to develop a pier in this area which appears to be prohibited under the above code, a variance from the Board of Standards and Appeals would likely be needed.	H	M	H		X	X	X				X	X	If permit is not granted, a different site or redesign would be required.
E-5	Farragut SPCC/SPDES	Utilizing oil-filled shunt reactors for the new Farragut 345kV substation being built on a platform in the East River may have difficulty with SPCC and SPDES permitting. High risk that an equipment failure would result in oil reaching navigable waterway.	L	L	L		X	X	X				X	X	
E-6	East River Tunnel Crossings- Farragut-Sprain Brook 345kV	Routes cross five Subway tunnels and the Battery Tunnel. MTA, Port Authority of NY/NJ, and potential other owners are likely to require permission to cross these pieces of infrastructure. There does not appear to be much of a precedent for crossing these tunnels with linear infrastructure. Has the potential of being a "no/go" condition if owners do not allow permission to cross. Moreover, the East River has potential shallow bedrock and the tunnels in the East River are in some cases very old and shallow. This could add further complications to crossing these tunnels. If proper burial depths could not be reached while crossing, armoring of the lines could be logistically challenging given some tunnels' ages.	M	M	H				X				X	X	5 tunnels will need to be crossed.
E-7	Hudson River Routing- Tunnel Crossing: To Buchanan and Farragut- Sprain Brook 345kV	Hudson Tunnels including the Lincoln, Holland, NJ Transit and multiple PATH tunnels will need to be crossed. MTA, Port Authority of NY/NJ, and potential other owners are likely to require permission to cross these pieces of infrastructure. There does not appear to be much of a precedent for crossing these tunnels with linear infrastructure.	H	H	H				X			X	X	X	5-10 tunnels will need to be crossed. Has the potential of being a "no go" condition if owners do not allow permission to cross.

Schedule Impact	More than 6 month	3-6 months	1-3 months	Less than 1 month

Item #	Risk Title	Description	Probability	Cost Impact	Schedule Impact	T036 Core 1	T037 Core 2	T038 Core 3	T039 Core 4	T040 Core 5	T041 Core 6	T042 Core 7	T043 En 1	T044 En 2	Comments
E-8	Hudson River Routing- The Narrows: To Buchanan	The Narrows themselves and the areas immediately north pose a physical constraint in the number of cables coming into Upper NY Harbor. An offshore wind project is proposing to come in on the east side of Ambrose Channel going to Gowanus substation and other offshore wind projects are likely considering to directly interconnect from offshore wind sites to onshore substations in New York City. Additionally, NYSDERDA was investigating meshed vs. radial interconnection to bring cables into NYC area given these constraints. • Implications: Given the limited amount of space that physically exists in the Narrows and setbacks between cables necessary for installation and maintenance, only a finite number of cables can be routed here. Ambrose Channel is the only deep draft channel to Upper New York Bay and is highly important to commerce; routing within the channel and limiting its navigability is likely to be an issue. Depending on the timing of the transmission project and the offshore wind generationTherefore, cables will likely need to be routed outside the Ambrose Channel. The abutments of the Verrazano Bridge further reduce the size of this area.	H	H	H							X	X	X	The density of existing infrastructure and regulated areas, and large number of users in this area add complexity to any routes passing through The Narrows.
E-9	Permitting Concern- Sprain brook Bay Addition	345kV AIS Bay addition will require a very large and complex retaining wall to accommodate the 60'-90' drop-off. It will be difficult to obtain permits due to its impact on the residential neighborhood.	VH	M	VH	X	X	X	X	X	X	X	X	X	
E-10	Permitting Concern- Cable Landing and Transition Substation at Davenport Park	Transition stations are required to interconnect the proposed 2-submarine cables per phase with the single terrestrial cable per phase. The proposed location where the submarine cables are coming ashore in the New Rochelle area at Davenport Park is in sensitive areas due to the park, beach, and adjacent country club. Construction of a transition station in these areas would have significant visual impact and may be subject to public opposition that may require relocation away from those sensitive areas. A similar project constructed in the 1990s in this area (near Davenport Park in New Rochelle) required securing property and the construction of a sizeable indoor substation building with a "residential" façade to hide the station.	H	M	H	X	X	X	X	X	X	X	X	X

Property, Routes and Siting Concerns															
P-1	Property Acquisition Concern - Proposed 345kV East Garden City Substation	The fenced area shown on the plot plan appears to impact the rear access for two adjacent commercial buildings.	H	M	L	X	X	X	X	X	X	X	X	X	Potential impact to adjacent buildings may require their purchase or other arrangement.
P-2	Route Concern- East Garden City Line Exits	All of the underground lines exiting East Garden City as shown in the map books are being routed in Stewart Ave, which is a busy road and congested with other existing underground utilities. This will make it difficult to construct. Obtaining sufficient available space within the public easement may be difficult such that there may not be sufficient space to install all of the lines.	H	H	H	X	X	X	X	X	X	X	X	X	Lines being routed in Stewart Ave include: 1 - 345kV to Dunwoodie (or 1 - 345kV to Farragut), 2 - 345kV to Sprain brook, 3 - 138kV to Newbridge 3 - 138kV to Valley Stream. Modifications to routes may be required.
P-3	Property Acquisition Concern - Sprain Brook	The addition of the three 345kV reactors are not entirely located within the utility's property. An adjacent property will need to be obtained.	H	L	L	X	X	X	X	X	X	X	X	X	
P-4	Property Acquisition Concern- Transition Station at Hempstead Harbor	A transition station is required to interconnect the proposed 2-submarine cables per phase with the single terrestrial cable per phase. The proposed location for the submarine cables coming ashore at Tappen Beach for the New Rochelle-Hempstead Harbor line is an existing gas regulator station.	VH	VH	M	X	X	X	X	X	X	X	X	X	The transition station will need to be built on a different site. May increase length of transmission lines.

Design Concerns															
D-1	Design Concern - Jamaica	The proposed design does not meet Con Edison's design principle. The proposed location for the breaker addition as shown on the Plot Plan is electrically in the wrong location. There is not sufficient space to install the breaker at the location proposed by the Developer. The location for the line exit down the side of the building would interfere with the building's door entrance and other equipment already mounted on the side of the building. Routing the underground cable through the parking lot will be difficult due to two water lines that are installed for the fire deluge system. Installing additional equipment on the roof of an existing building may result in the need for significant structural reinforcement. Spacing is extremely congested. The installation of GIS bus and equipment would require the existing, open air 138kV bus to be de-energized to safely conduct the work. Any future maintenance on the GIS bus, or replacement thereof due to electrical failure, would require other station components, such as open-air bus, to be de-energized.	VH	VH	M	X	X	X	X	X	X	X	X	X	Per Con Edison's specification (CE-ES-2002-I), equipment needs to be arranged such that a failure does not jeopardize the continued operation of the facility. The most likely means for mitigation would be to build a new facility on an adjacent property.
D-2	Design Concern- Northport HVDC	Design shows three 138kV lines tied to the HVDC converter. However, there is no means shown or space provided for tying these lines together and connecting to the HVDC interface transformers. Interconnecting the HVDC to 138kV results in high current (5000A), which increases the complexity of the design. The space allocated is the same as Sprain brook which ties to one 345kV line.	H	M	L						X	X	X	X	Assumed a 3-breaker ring will be required. Costs are included in Independent cost estimate.
D-3	Design Concern- Northport	The underground cables running the length of the existing substation from the proposed transformers to the proposed GIS will be crossing several 12'-16' deep tunnels that run from the plant to the discharge area across the substation. Some are only 5'-6' below grade. These may cause interference with installing the proposed cables.	H	M	M			X	X	X	X	X	X	X	
D-4	Design Concern- Northport	The location for the proposed transformer and 345kV line and the proposed HVDC facilities may interfere with an existing 8" oil pipe that runs from off the coast to the oil tank farm.	M	M	L			X	X	X	X	X	X	X

D-5	Design Concern-Barrett HVDC	Design shows three 138kV lines tied to the HVDC converter. However, there is no means shown nor space provided for tying these lines together and connecting to the HVDC Interface transformers. Interconnecting the HVDC to 138kV results in high current (5000A) which increases the complexity of the design. The space allocated is the same as Sprain Brook which ties to one 345kV line.	H	M	L								X		Assumed a 3 breaker ring will be required. Costs are included in Independent cost estimate.
D-6	Design Concern-Buchanan HVDC	Design calls for two HVDC stacked converters. However, the space shown is the same as for one converter. Additional property may be required for additional equipment for two converters.	H	H	L									X	
D-7	Design Concern-Buchanan HVDC	The planned location for the HVDC station impacts an existing 345kV transmission line. The proposed design does not address the relocation of the line.	H	M	L							X		X	
D-8	Design Concern-HVDC Cable Size	Estimate documents state that the size for the HVDC cable is to be 2000mm ² . This size cable is the minimum required to meet the ampacity requirements. It may be determined to be undersized during detailed engineering once specific Geotech information, cable crossings and duct bank configuration are determined.	M	M	L						X	X	X	X	Independent estimate utilized a larger size cable.
D-9	Design Concern-345kV PAR East Garden City	Manufacturer, who responded to SECO's budgetary quotation request, indicated that PAR of the proposed size (1050 MVA) cannot be built. Two 3-phase or three 1-phase parallel PARs are required. Design modification is required. There may not be sufficient space to accommodate additional equipment.	H	H	L	X	X	X	X	X	X	X	X	X	Additional property may need to be acquired. Independent estimate included cost for two 3-phase PARs.
D-10	Design Concern-345kV PAR Ruland Road	Manufacturer, who responded to SECO's budgetary quotation request, indicated that PAR of the proposed size (1050 MVA) cannot be built. Two 3-phase or three 1-phase parallel PARs are required. Design modification is required. There may not be sufficient space to accommodate additional equipment.	H	H	L		X	X					X	X	Additional property may need to be acquired.
D-11	Design Concern-345kV PAR Buchanan	Manufacturer, who responded to SECO's budgetary quotation request, indicated that PAR of the proposed size (1050 MVA) cannot be built. Two 3-phase or three 1-phase parallel PARs are required. Design modification is required. There may not be sufficient space to accommodate additional equipment.	H	H	L									X	Additional property may need to be acquired.
D-12	Design Concern-Newbridge Road Underground Cable Crossings	138kV underground cables will be crossing each other and crossing 345kV underground cables within the substation. This will require deeper duct banks and will impact the cables' ampacity ratings.	H	L	L	X	X	X	X	X	X	X	X	X	Final cable sizing will need to take into account the cable depths and the crossings in the substation.

Project:	T036-T044
Developer:	NextEra
Project Name:	Core 1, 2, 3, 4, 5, 6, 7, Enhanced 1, Enhanced 2

	Very High (VH)	High (H)	Medium (M)	Low (L)
Probability Risk Will Occur	90-100%	50-89%	10-49%	Below 10%
Cost to Mitigate Risk	Greater than \$20M	\$11M-20M	\$6-\$10M	Below \$5M
Schedule Impact	More than 6 month	3-6 months	1-3 months	Less than 1 month

Item #	Risk Title	Description	Probability	Cost Impact	Schedule Impact	T036 Core 1	T037 Core 2	T038 Core 3	T039 Core 4	T040 Core 5	T041 Core 6	T042 Core 7	T043 En 1	T044 En 2	Comments
D-13	Design Concern-Newbridge	The proposed location for the new GIS is currently occupied by a 138kV bay that ties to the low side of Bank #2 and the high side of Bank #9. The bay area is elevated approximately 10' above the rest of the station. The proposed GIS building extends beyond this elevated area requiring additional grading and a retaining wall. Also the GIS building will interfere with an existing oil pump building and an underground oil tank.	H	M	L	X	X	X	X	X	X	X	X	X	The existing oil pump building and associated oil lines along with the oil tank will need to be relocated.
D-14	Design Concern-Dunwoodie 345kV Existing Lines	The proposed location for the 345kV GIS is in the ROW of three 345kV transmission lines. The design does not provide a means to relocate the existing three 345kV lines to allow the GIS building to be constructed nor a means to interconnect them into the proposed substation. Due to the low-grade clearances and two of the existing lines being on double circuit poles in a vertical orientation, it will be very difficult to transition the lines to underground cables or GIS while meeting the system outage and restoration requirements.	VH	VH	VH	X	X	X	X	X	X	X	X	X	Will require long outages of the 3-345kV lines.
D-15	Design Concern-Dunwoodie New 345kV Line Exits	Due to a rock outcropping and a significant drop in elevation along the eastern side of the substation and ROW, it will be difficult to route a new underground line out of the proposed GIS towards the east, as proposed.	H	H	L	X	X	X	X	X	X	X	X	X	
D-16	Design Concern-Sprain Brook Bay	Proposed 345kV AIS bay on the east side of the substation will be very difficult to construct due to the 90' drop off in this area. A very large and complex retaining wall would be necessary which is not included in NextEra's design. It will be difficult to construct due to the limited access available and the impact on the residential neighborhood.	VH	VH	H	X	X	X	X	X	X	X	X	X	
D-17	Design Concern-Sprain Brook Proposed 345kV Line Exits	Due to a rock outcropping and a significant drop in elevation along the eastern and western side of the substation, it will be difficult to route an underground line, as proposed.	H	H	L	X	X	X	X	X	X	X	X	X	
D-18	Design Concern-Potential Flooding or Inundation by Storm Surge	Some proposed substations are located in or near a 100-year or 500-year flood zone and/or have the potential for being inundated by a Category 1 storm. The proposals do not address how the substations will be designed to reduce the potential impact of flooding.	H	M	L	X	X	X	X	X	X	X	X	X	Projects have five to ten substations potentially impacted with a Risk score ranging from 19 to 45. With 45 being the highest risk score of all proposals evaluated.

	Very High (VH)	High (H)	Medium (M)	Low (L)
Probability Risk Will Occur	90-100%	50-89%	10-49%	Below 10%
Cost to Mitigate Risk	Greater than \$20M	\$11M-20M	\$6-\$10M	Below \$5M
Schedule Impact	More than 6 month	3-6 months	1-3 months	Less than 1 month

Item #	Risk Title	Description	Probability	Cost Impact	Schedule Impact	T036 Core 1	T037 Core 2	T038 Core 3	T039 Core 4	T040 Core 5	T041 Core 6	T042 Core 7	T043 En 1	T044 En 2	Comments
D-19	Design Concern - PARs are Not Equipped with Bypass Switch- Corona and Buchanan	A failure of the PAR at Corona will result in a long-term outage of the 138kV line from Corona to Jamaica and failure of PAR at Buchanan will result in a long-term outage of the 345kv line from Buchanan to Eastview. Also, an outage of the lines will be required to perform maintenance on the PAR.	M	L	L									X	
D-20	Design Concern- Farragut Substation	The proposed design does not meet Con Edison's design principle. The proposed design requires the use of 345kV Gas Insulated Bus Work (GIB) and 345kV cables to connect the proposed substation to the existing facility. The installation of GIB would impede the replacement of existing Con Edison assets and the operations of the facility. Due to the below grade congestion around the Farragut substation, it is not feasible to install underground cables.	VH	H	H		X	X	X				X	X	
D-21	Design Concern - Reactors Not Equipped With Breakers- Buchanan, Ramapo and Sprain brook.	A failure of a shunt reactor will result in a long-term outage of the associated 345kV lines. Also an outage of the line will be required to perform maintenance.	M	L	L	X	X	X	X	X	X	X	X	X	One 345kV Reactor at Buchanan One 345kV Reactor at Ramapo Up to three 345kV Reactors at Sprain Brook
D-22	Design Concern- Multiple Circuits in Same Duct Bank- Lower Risk 50 miles or less	All projects included transmission sections where multiple circuits are installed in the same duct bank. This has the potential for all circuits being damaged if a strike occurred.	L	L	L	X		X	X	X	X				Five or less segments totaling less than 50 miles.
D-23	Design Concern- Multiple Circuits in Same Duct Bank- Higher Risk More Than 50 miles	All projects included transmission sections where multiple circuits are installed in the same duct bank. This has the potential for all circuits being damaged if a strike occurred.	M	L	L		X					X	X	X	Six or more segments totaling more than 50 miles.
D-24	Design Concern- Rainey	The proposed design does not meet Con Edison's design principle. Due to the location of the existing access road, surrounding equipment and a below grade oil tank, there is insufficient space between breakers 1E and 2E for the installation of a line terminal. Also it will be very difficult to install the underground cable through the substation, as proposed, due to interference with existing tunnels that run between Rainey and the Ravenswood plant, transformer oil containment pits and a security brick wall.	VH	VH	H	X	X	X	X	X	X	X	X	X	Major modifications to the existing infrastructure would be required to accommodate this installation.

Construction and Operational Concerns															
C-1	Construction Concern Installing Underground Cables in Existing Substations.	Installing proposed underground cables in the existing substations will be difficult without impacting existing foundations, conduit/trench systems, grounding, and buswork. Such installation could require additional or concurrent outages, complex construction sequences and/or more expensive construction methods.	H	M	M	X	X	X	X	X	X	X	X	X	Number of underground cables being routed through the existing substations include: Barrett - five 138kV cables EGC - three 138kV cables (2 cables cross each other) and two 345kV cables Newbridge - six 138kV cables with 13 crossings and four 345kV cables Rainey - three 345kV cables Ruland Rd. - three 138kV cables Valley Stream -three 138kV cables Corona - one 138kV cable Farragut - one or two 345kV cables Northport - five 138kV cables
C-2	Construction Concerns- HVDC Lead Times	Due to high demand and equipment complexities, manufacturers are quoting lead times up to 4 years for onshore HVDC converter stations and 5 years for onshore/offshore HVDC converter stations. It will take an additional six months to install, test, and commission a second unit.	H	L	H						X	X	X	X	
C-3	Construction Concerns- Sprain Brook HVDC Substation - Subsurface Condition	Approximately 90% of the site could encounter rock during excavation and the site might require extensive slope protection. Site conditions will require further investigation to quantify. This could have high cost and schedule impact depending on volume of rock excavation and methods used (i.e., blasting likely not allowed in this area)	H	M	L						X	X	X	X	Independent estimate has assumed that rock excavation is required.
C-4	Construction Concerns- New Rochelle-Dunwoodie, New Rochelle-Sprain Brook	Construction of the underground cables within a roadway requires approximately 30'-35' width for vehicles and equipment. Davenport Ave and Church St. near the Davenport Park transition station are only 25' wide. Therefore, the entire road way would be closed down during construction eliminating the only access to homes on the peninsula.	VH	VH	M	X	X	X	X	X	X	X	X	X	An alternate route will be required which may increase the length of the circuits.

Developer:	NextEra
Project Name:	Core 1, 2, 3, 4, 5, 6, 7, Enhanced 1, Enhanced 2

	Very High (VH)	High (H)	Medium (M)	Low (L)
Probability Risk Will Occur	90-100%	50-89%	10-49%	Below 10%
Cost to Mitigate Risk	Greater than \$20M	\$11M-20M	\$6-\$10M	Below \$5M
Schedule Impact	More than 6 months	3-6 months	1-3 months	Less than 1 month

Item #	Risk Title	Description	Probability	Cost Impact	Schedule Impact	T036 Core 1	T037 Core 2	T038 Core 3	T039 Core 4	T040 Core 5	T041 Core 6	T042 Core 7	T043 En 1	T044 En 2	Comments
C-5	Construction Concern- Pipe Type Cables	One 345kV line and several 138kV transmission lines that are to be intercepted and tied into a proposed substation are oil-filled, pipe type cables. Tying into these type of cables requires managing the oil pressure and transitioning to EPR which adds an additional level of complexity to the construction. The extent of work required will be dependent on the cable's condition and age.	H	L	L	X	X	X	X	X	X	X	X	X	Barrett-Valley Stream 291 and 292 transition from EPR to oil pipe type cables in a vault outside of the Barrett substation. The pipe cables are tied together and the oil pressure is managed at Valley Stream. Barrett-Freeport 459 line Northport-Pilgrim 672, 677, 679 transition from EPR to oil pipe type cables in a vault outside of the Northport substation. Rainey-Mott Haven
C-6	Construction Concern- East Garden City 345kV Underground Cables to PARs	The proposed route for the underground cables to tie the existing 345kV PARs to the proposed GIS substation is along the west side of the substation heading north. Along the west side of the substation is a double-circuit overhead 138kV Lines 361 and 362 along with an overhead distribution circuit and communication circuit. There is a large double-circuit lattice structure for Lines 361 and 362 located in the north west corner of the substation adjacent to a building. Due to these interferences it will be very difficult to install the 345kV cables through this area.	H	L	L	X	X	X	X	X	X	X	X	X	An alternate route for the 345kV PARs will be required.
C-7	Construction Concern- East Garden City 345kV Cables to Transformers and 138kV Cable to Proposed PAR	The proposed route for the underground cables to tie the existing 345kV transformers to the proposed GIS substation and the 138kV cable to the proposed PAR are exiting towards the east and then turning north. It will be difficult to exit the substation to the east since there are three gas lines (30", 20", 8"), one 138kV pipe-type cable (Line 463), and 8" water lines that run North-South along the east side of the station that will need to be crossed.	H	L	L	X	X	X	X	X	X	X	X	X	An alternate route for the 345kV transformers would be required.
C-8	Construction Concern- Outages of Existing Facilities	In order to construct the project several existing elements (transformers, PARs, transmission lines, main busses) will need to be removed from service. Being able to schedule outages can impact the project schedule. Having a single element or multiple concurrent elements out of service can impact the reliability of the system.	VH	M	H	X	X	X	X	X	X	X	X	X	Number of elements out of service for 7 days or more: 51-58 Maximum # of concurrent elements: 5 # of elements out for more than 90 days: 7

Environmental and Permit Concerns												
E-1	Cable and Pipeline Crossing	The waters surrounding Long Island and New York City contains a large number of exiting submarine linear infrastructure, including electric/telecommunication cables and pipelines. Crossing of linear infrastructure will likely require approvals from the asset owner. Failure to receive permission to cross exiting linear infrastructure could result in a specific submarine route not being feasible.	L	L	L	X	X	X	X	X	X	These projects have 1 cable crossing. Existing infrastructure, including pipelines, communications and electric cables, would require authorization from the owners to cross. Most approvals would likely be part of the Article VII process, but any federal approvals would be separate.
E-2	Navigation Channels and Anchorages- Lower Risk	The waters surrounding Long Island and New York City contain a large number designated channels and anchorage. Therefore, routing through this area is very complex and will cross multiple navigation features. • Implications: This work will need to be completed in a manner that does not impact navigation in the busy New York port. This is likely to include HDD across high traffic areas. A USACE Section 408 permit will be required and if numerous and/or large lengths of channels/anchorages are crossed this could be a lengthy process. Additionally, crossing anchorages and channels requires increased burial depth. Current guidance from USACE is 15 feet below authorized depth or the actual maintained depth, whatever is deeper. Furthermore, if areas of high contamination are crossed, regulatory agencies could require alternate cable burial methods, which could be more time consuming and costly (i.e., mechanical dredging with an environmental bucket and backfilling with clean fill).	L	L	L	X	X	X	X	X	X	These projects cross 2 navigation areas and 3 anchorage areas. Crossing of Navigation Channels and Anchorage Areas would require authorization from the USACE under Section 408. The USACE may require low-impact crossing methods such as HDD, or may deny the authorization outright.

E-3	Contaminated Sediment- East River	The seafloor sediments in the areas surrounding Long Island and New York City contain known areas of contamination, as well as areas that are likely to contain contaminated sediments, as a result of historic industrial activities and discharges. The bottom disturbance necessary to install a submarine cable into the seafloor has the potential to resuspend these contaminated sediments. Agencies are likely to require avoidance and rerouting around areas of high contamination. This area has either known contamination or suspected contamination.	L	L	L	X	X	X	X	X	X	This impacts 1 Circuit to Tremont- 1.2 Miles Propel NY plans to cross the river using Horizontal Directional Drilling (HDD). Based on this plan, there is minimal chance that contaminated sediment will be impacted.
E-4	Contaminated Site- Northport	The proposed location for the HVDC converter station at Northport is at a large above-ground storage oil tank farm. Subsurface contamination could be found here. The need to address the contamination could impact cost and schedule. A full environmental survey prior to construction may be required to ensure there is no soil contamination.	M	M	M						X	

Property, Routes and Siting Concerns												
P-1	Property Acquisition Concern- Eastern Queens	Utility may be utilizing available property at the site. If Propel NY is unable to secure property, current plan may not contain sufficient property to build the proposed substation.	H	M	L					X	X	
P-2	Property Acquisition Concern- East Garden City	Utility may be utilizing available property at the site. If Propel NY is unable to secure property, current plan may not contain sufficient property to build the proposed substation.	M	M	L	X		X	X	X		
P-3	Route Concern- East Garden City Line Exits	Some of the underground lines exiting East Garden City, as shown in the map books, are being routed in Stewart Ave, which is a busy road and congested with other existing underground utilities. This will make it difficult to construct. Obtaining sufficient available space within the public easement may be difficult such that there may not be sufficient space to install all of the lines.	M	M	M	X		X	X	X		Lines being routed in Stewart Ave include: 1-345kV EGC-Tremont (Base 1, 3, Alt 5 and Alt 6) 1-345kV EGC- Shore Rd. (Base 1, 3, Alt 5 and Alt 6) 1-345kV EGC- Eastern Queens (Alt 6 Only) 1-138kV EGC-Shore Rd. (Base 3 Only)

Design Concerns												
D-1	Design Concern- Use of 5900kcmil DC Submarine Cable	A conductor size above 5000kcmil will likely limit the number of manufacturers that are able to offer this size cable. 345kV cables sized 5900kcmil are at the limit of manufacturing capability. There is a risk that the 5900kcmil does not meet the capacity requirement once specific Geotech information, cable crossings, and duct bank configuration are determined during detailed engineering. Since a larger size cable is unavailable, the only option would be to use multiple cables per phase to satisfy ratings, which would require a larger cable trench to accommodate more conduits.	L	M	M						X	
D-2	Design Concern- Multiple Circuits in Same Duct Bank- Lower Risk 50 Miles or Less	There is one line segment that has two circuits in the same duct bank. This has the potential risk of two or more circuits being damaged if the duct bank was compromised.	L	L	L			X	X	X	X	Base 3: Barrett-EGC- 2 ckts, 8.8 Miles Alt 5: Shore Rd-New Rochelle-Sprain Brook- 2 ckts, 8.1 miles Alt 6: EGC to Eastern Queens- 2 ckts, 11.7 miles Alt 7: Barrett-Eastern Queens 2 ckts, 11 miles
D-3	Design Concern - No Spare Power Cable Conduit	Replacement of a failed cable could be more difficult without a spare conduit.	L	L	L	X	X	X	X	X	X	
D-4	Design Concern- Barrett Offshore Wind Interconnection	The proposal assumes that a new offshore wind substation that connects into Barrett will be designed to accommodate two 345kV lines from Propel NY's proposed Barrett substation.	M	H	H	X	X	X	X	X	X	
D-5	Design Concern- Potential Flooding or Inundation by Storm Surge	Some new substations are located in or near a 100-year or 500-year flood zone and/or have the potential for being inundated by a Category 1 storm.	M	M	L	X	X	X	X	X	X	Projects have 3 to 5 substations potentially impacted with a risk score ranging from 16 to 24.
D-6	Design Concern - PARs are Not Equipped with Bypass Switch	Without a means to bypass a PAR, its failure will result in a long-term outage of the associated line. Also, an outage of the line will be required to perform maintenance on the PAR.	M	M	L	X	X	X	X	X	X	There are a total of four to nine PARs in a project.

	Very High (VH)	High (H)	Medium (M)	Low (L)
Probability Risk Will Occur	90-100%	50-89%	10-49%	Below 10%
Cost to Mitigate Risk	Greater than \$20M	\$11M-20M	\$6-\$10M	Below \$5M
Schedule Impact	More than 6 month	3-6 months	1-3 months	Less than 1 month

Item #	Risk Title	Description	Probability	Cost Impact	Schedule Impact	T047 Base 1	T048 Base 2	T049 Base 3	T051 Alt 5	T052 Alt 6	T053 Alt 7	Comments
D-7	Design Concern- Dunwoodie- Insufficient Space for Line Terminal	Per the one-line diagram, the project plans to add a 345kV line terminal to Eastern Queens between the breakers 6 and 8. However, the plot plan shows the connection to the existing GIS equipment between breakers 3 and 4. There is not sufficient space between breakers 6 and 8 to add the line terminal.	VH	H	H					X	X	A significant rebuild of the existing GIS would be required to add this line terminal leading to long outages of the facilities.
D-8	Design Concern- Dunwoodie Proposed 345kV Line Exit	Due to a rock outcropping and a significant drop in elevation along the eastern side of the substation and ROW, it will be difficult to route an underground line out of the proposed GIS towards the east, as proposed.	H	H	L					X	X	
D-9	Design Concern- Sprain Brook Proposed 345kV Line Exits	Due to a rock outcropping and a significant drop in elevation along the eastern and western side of the substation, it will be difficult to route an underground line, as proposed.	H	H	L	X	X	X	X	X	X	
D-10	Design Concern- Tremont	The proposed GIS equipment, which Propel NY preliminary identified as a potential NUF, is to be installed at the location of the existing bus connections between Banks 1 and 2 and the tie to the 345kV X28 line to Sprain Brook. The construction of the proposed NUF would require an extensive outage of the transformers and the line. Also, the proposed location of the control house will cut off access to the northern side of the substation.	H	M	M	X	X	X	X	X	X	In order to mitigate the outage, the potential GIS equipment may need to be installed on an adjacent property.
D-11	Design Concern- Barrett 138kV	There is insufficient space to replace the existing breaker 1330 with a double PASS breaker due to a large lattice deadend structure that would interfere with this	H	L	L		X				X	To mitigate this concern, the deadend structure would need to be relocated.
D-12	Design Concern- East Garden City Proposed 345kV Reactor	The location for the proposed 345kV reactor will interfere with a main cable trench and access road. In addition, the Plot Plan provided incorrectly shows the location of the existing Y49 line exit. Therefore, the proposed 345kV reactor will extend further to the west than shown. It may not fit within the fenced area of the substation. Also, the reactor would be installed under the double ckt overhead Lines 361 and 362, a distribution, and communication circuits.	H	H	M		X				X	Additional property may be required. Outages of Lines 361 and 362 may be required during construction, which is not identified in the Outage Plan. Also relocation of the distribution and communication circuits would be required.

D-13	Design Concern- East Garden City 345kV Cables to Existing PARs	The proposed route of the 345kV cables from the existing PARs to the proposed substation is shown being routed through the 69kV yard. This will need to be routed around this existing equipment, including two new switchgear buildings, which do not show up the aerial view of the substation.	M	L	L	X		X	X	X		
D-14	Design Concern- Newbridge	Circuit breaker 1460 is to be replaced with a double PASS breaker. However, there are two underground cables (Lines 463 and 465) crossing this area, which may cause interference with the breaker's foundation.	L	L	L	X		X	X	X		
D-15	Design Concern- Northport	The new 138kV underground cables running to the proposed PAR will cross several 12'-16' deep tunnels that run from the plant to the discharge area. Some are only 5'-6' below grade. Also, the underground termination being installed next to breaker 1450 is the location of one of the tunnels. These may cause interference with installing the proposed cables.	H	M	M				X			
D-16	Design Concern- Jamaica- Lake Success 903 Line Cooling	The project requires forced cooling to be added to the lines to increase their capability. However, the required cooling equipment is not shown on the substation plans. There may not be adequate space at Jamaica station to add the required equipment.	H	M	M		X			X

Construction and Operational Concerns												
C-1	Construction Concern - Installing Underground Cables in Existing Substations	Installing underground cables in the existing substations will be difficult without impacting existing foundations, conduit/trench systems, grounding, and buswork. This could require additional or concurrent outages, complex construction sequences, and/or more expensive construction methods.	M	L	L	X	X	X	X	X	X	Number of underground cables being routed through the existing substations include: Barrett - two 138kV cables EGC - two 138kV cables Ruland Rd. - two 138kV cables Shore Rd- one 138kV cable Sprainbrook - one 345kV cable Northport- two 138kV cables
C-2	Construction Concern- Sharp Right Turn	Shore Rd.- New Rochelle- Sharp right-hand turn from Hudson Park Rd. onto Pelham Rd. Also, high traffic area.	M	L	L	X	X	X	X	X	X	Recommend identifying an alternate route for this portion of the line due to this sharp right-hand turn. Possible consideration for routing through Leif Ericsson Park.
C-3	Construction Concern- Railroad Tracks in Use	East Garden City-Tremont: Railroad tracks appear to be in use. If tracks are in service this would potentially require limited amount of working time adjacent to the RR Tracks while the train is moving. This could impact the construction schedule.	M	M	M	X		X	X	X		Recommend confirming whether railroad tracks are in use
C-4	Construction Concern- HDD for Small Retention Pond	East Garden City to New Bridge to Ruland Rd. - Developer proposed trenching across a pond located between Stewart Ave and Broadway.	L	L	L	X		X	X	X		HDD would be more feasible and logical solution. Recommend HDD for small retention pond
C-5	Construction Concern- Length of HDD	The use of HDD across the East River to Tremont is about a mile long. This is approaching the limit of the HDD capability. Being able to use this technique will be dependent on the geological conditions and being able to obtain the necessary cable reels. This impacts lines from East Garden City to Tremont, Barrett to Tremont, and Eastern Queens to Tremont.	M	M	M	X	X	X	X	X	X	
C-6	Construction Concern- Space for Transition Joints from Submarine to Terrestrial Cables.	The below grade transition vaults are to be located in Hudson Park. This is a very active summer recreational area. Therefore, the construction window will be limited.	H	L	L	X	X	X	X	X	X

I. EXECUTIVE SUMMARY

The NYISO tariff allows for recovery of the costs of transmission projects that are built to achieve Public Policy Requirements (“PPRs”) from New York State laws or regulations. The tariff requires NYISO to issue a report detailing its evaluation of the proposed projects and identifying which (if any) is the more efficient or cost-effective project for satisfying the Public Policy Transmission Need (“PPTN”). The tariff also requires the Market Monitoring Unit (“MMU”) to “review and consider” any impact on the ISO-administered markets from regulated transmission solutions proposed to satisfy the PPTN, and then the MMU is to provide a report containing its evaluation to stakeholders before the Management Committee advisory vote on the Public Policy Transmission Planning (“PPTP”) Report.¹

In 2019, New York State enacted the Climate Leadership and Community Protection Act (“CLCPA”), which mandates 70 percent of electricity from renewables by 2030, the installation of 9 GW of offshore wind by 2035, and zero emissions from the electricity sector by 2040. In 2021, the NYPSC issued an order identifying the Long Island Offshore Wind Export PPTN and referring it to the NYISO for solicitation and evaluation under its PPTP Process.² The order declared that the CLCPA constitutes a PPR driving a need for transmission to increase export capability from Long Island to the rest of New York State to ensure deliverability of the full output of offshore wind interconnected to Long Island. The order defined the PPTN as:

- 1) Adding at least one bulk transmission intertie cable to increase the export capability of the LIPA-Con Edison interface, that connects NYISO’s Zone K to Zones I and J to ensure the full output from at least 3,000 MW of offshore wind is deliverable from Long Island to the rest of the State; and
- 2) Upgrading associated local transmission facilities to accompany the expansion of the proposed offshore export capability.

The order indicated that the PPTN was driven by the 2030 and 2035 mandates in the CLCPA. It discusses the need for transmission to satisfy the 2035 mandate to install 9 GW of offshore wind assuming that 3 GW would likely interconnect on Long Island.

Developers submitted 19 proposals for satisfying the PPTN. The NYISO found 16 transmission solutions that would satisfy the Viability and Sufficiency Criteria of allowing 3 GW of offshore wind to connect to Long Island without being curtailed. The NYISO performed a study of the costs and benefits of these projects.

¹ See NYISO Market Services Tariff Section 30.4.6.8.5.

² See PSC Case No. 20-E-0497, *In the Matter of New York Independent System Operator, Inc.’s Proposed Public Policy Transmission Needs for Consideration for 2020*, Order Addressing Public Policy Requirements for Transmission Planning Purposes (March 19, 2021).

The NYISO estimated the overnight capital costs and assessed potential development risks and proposed cost caps of each project against the projected:

- Economic benefits from lower electricity production costs,
- Cost savings from reducing investment in (a) renewable generation in upstate areas and (b) dispatchable generation in downstate areas,
- Reduced curtailment of offshore wind generation on Long Island, and
- Other benefits from enhancing the bulk power system such as: expandability of new infrastructure and operability of transmission equipment.

Based on its evaluation, NYISO staff has recommended that the NYISO Board of Directors select Project T051, also known as Propel NY's Alternative 5.

As MMU, we evaluate the market effects of individual projects considering that an inefficient project can harm the electricity markets by distorting energy and capacity prices in the short-term, crowding-out more cost-effective investment, and inflating market risks in the long-term. However, this assessment of projects' economic efficiency must include factors that are not priced in the NYISO markets (such as the degree to which they facilitate renewable energy production). Inefficient projects (i.e., projects whose costs exceed the priced and unpriced benefits they produce) harm the NYISO markets and ultimately raise the cost of satisfying the Public Policy Requirement. This principle is discussed in more detail in Section II. The remainder of this executive summary discusses our evaluation and conclusions. Sections II, III, and IV present our evaluation and Section V provides our conclusions and recommendations.

Quantitative Evaluation Metrics

NYISO staff presented several quantitative and qualitative metrics of the projects' market and reliability impacts and investment costs and outlined how these metrics were considered in its recommendation of Project T051. The following summarizes how we consider the diverse set of metrics and modeling results calculated by the NYISO or derived from its evaluation:

- **Production Cost Savings** – These include reductions in fuel costs, variable O&M costs, CO₂ emissions allowance costs, and other generator production costs across the region. However, the impacts of Renewable Energy Credits ("RECs") on incremental energy offers are excluded from this category and considered separately as discussed below.
- **Avoided Cost of Investment in Dispatchable Generation** that would otherwise be needed to satisfy the minimum resource adequacy and transmission security planning standards.
- **Avoided Cost of Investment in Renewable Generation** that would otherwise be needed to satisfy the CLCPA because of increased deliverability of offshore wind.
- **Transmission Financing and O&M Costs** – It is important to consider the full construction and life-cycle costs of new transmission investments, although the NYISO did not consider these in its evaluation.

- Reduced Curtailment of Offshore Wind – The primary rationale for the Public Policy Requirement was that it would increase deliverability of offshore wind on Long Island.

We include the first four categories above in a single Benefit-Cost Ratio (“B-C Ratio”), which provides an overall measure of the cost of the project relative to the benefits. The benefits are the cost savings that result from satisfying the CLCPA goals with the transmission project versus without it.³ Hence, the B-C Ratio indicates whether the proposed transmission project is a cost-effective means of achieving the CLCPA goals. In addition, we combine the five categories above into another comprehensive metric:

- Implied Net REC (“INREC”) Cost – This is the average cost of increased renewable production resulting from the new transmission project (after netting out the value of wholesale market benefits). This allows us to compare the net cost of a transmission investment to unbottle renewables with other alternatives for supporting higher renewable production, including investing in energy storage that reduces curtailment of renewables or simply building more renewables. Transmission projects are cost-effective when their INREC Cost is lower than these alternatives.

The inputs to the Benefit-Cost Ratio and Implied Net REC Cost are provided on an annual basis to illuminate how the benefits of the project change relative to the levelized costs over the first 20 years of investment. Sections III and IV provide additional details about these quantitative metrics including key differences between our methodology and the NYISO methodology.⁴

Qualitative Evaluation Metrics

In recommending project T051, the NYISO discussed several qualitative benefits including the expandability and operability benefits of a project that adds three 345 kV circuits between Long Island and other zones. Expandability is the degree to which a project may facilitate additional expansion of generation and transmission. Operability is the extent that a project affects flexibility in operating the system, such as access to operating reserves, access to ancillary services, or the ability to remove transmission for maintenance.

While these benefits are material, it is important to quantify benefits in a manner that enables a fair comparison of projects and facilitates competition among developers. Regarding “expandability”, capacity expansion models quantify the impact of proposed projects on other future investments, so the NYISO’s capacity expansion model is designed to quantify the

³ Since the CLCPA goals are achieved with or without the project, the accumulation of RECs is not counted as an additional category of benefit in the B-C Ratio of the transmission project.

⁴ We omit the NYISO’s “Capacity Benefit LOLE Reduction” metric from our evaluation because the NYISO’s methodology for calculating capacity benefits is flawed and because most of the real capacity benefit is reflected in our Dispatchable Generation Investment Cost Savings. While this does not include real capacity benefits of improved reliability, we expect this reliability benefit to be relatively small for this solicitation (because of the reduction in dispatchable generation investment). See our discussion of capacity benefits in Appendix G of the *AC Transmission Public Policy Transmission Planning Report*.

economic value of expandability. As the NYISO refines its capacity expansion model, it should be able to rely less on the “expandability” metric in future studies.

The value of “operability” depends on system conditions, the costs of maintaining security and reliability, and how they are affected by new transmission facilities. Hence, the value of operability is already partially reflected in the production cost savings and avoided cost of investment metrics. Such benefits could be quantified more fully by enhancing the production cost model to account for outages, ancillary services, and other real factors affecting the value of transmission. These enhancements would allow the NYISO to rely more on quantitative measures in future studies, which provide a better basis for comparing competing solutions.

Summary of Assessment of Cost and Benefits

Given the limited time available to review the NYISO evaluation, our review focuses on the NYISO’s Policy + Barrett-VS + P95 Variability Scenario (“Policy+B-VS+P95”). Key features of this scenario include:

- Policy Case offshore wind buildout – This assumes 2.5 GW of Long Island offshore wind is installed by 2030 and 3.7 GW by 2035. This scenario assumes that more than 3 GW of the 9 GW mandated by 2035 would be installed in Long Island.
- The Barrett-Valley Stream constraint – Accounts for the transmission constraint responsible for most offshore wind curtailments through 2035 (rather than assuming the affected wind developer will resolve the constraint or relocate its interconnection point).
- P95 Net Load Variability impact – Assumes some transmission capability between Long Island and other regions will be used to manage intermittent generation variability, thereby reducing available capability for power transfers to and from Long Island. While this scenario approximates these transmission effects, the other scenarios underestimate the offshore wind curtailments that will result from net load variability and uncertainty.

Of the scenarios modeled, the Policy+B-VS+P95 Policy provides the best overall indication of the impacts of the proposed transmission projects. We also limit our review to NYISO’s recommended project (T051) and Project T048 (“Propel NY’s Base Solution 2”) because T048 was the top-tier proposal with the lowest capital costs while retaining much of the benefits of T051. The evaluation of both projects in the Policy+B-VS+P95 Scenario is presented below.

(i) Benefit-Cost Ratio

Based on our recalculation of both benefits and costs, Figure 1 compares the benefits and costs of the projects based on the NYISO assessment and our MMU assessment. Our assessment shows that the combined benefits for the T051 project are substantially less than the costs, yielding a Benefit-Cost Ratio of 0.81 over the 20-year period from 2030 to 2049. “NYISO (P95 Case)” implies higher overall benefits and lower costs. The estimate labeled “NYISO (P95 Case, MMU Discount)” shows that the benefits would be higher if they were appropriately discounted

to 2022 dollars.⁵ Our estimates of benefits and costs differ from the NYISO estimates in several ways, which are explained below (while Section IV provides a more detailed discussion of differences).

Avoided dispatchable generation.

This accounts for the largest difference in benefit values. We find the NYISO's analysis to be unrealistic in this area.⁶ The NYISO assumes a substantial cost difference for building Dispatchable Emission-Free Resources ("DEFR") on Long Island versus upstate NY.

Therefore, if new transmission reduces the need for DEFRs on Long Island, the need for them can be met by building them upstate. This raises two issues. First, we do not yet know what potential DEFR technologies will exist by 2040, so the costs and characteristics of future DEFRs

are very speculative.⁷ Our estimate assumes that the marginal resource to satisfy future capacity requirements will be a peaking technology that is a lower-fixed cost, higher-variable cost option. Second and more troubling is that such resources cannot reasonably be shifted from Long Island to upstate NY because the transmission network would not support such a shift. Our estimate assumes that the UPNY-ConEd interface between the Hudson Valley and downstate areas would require that the DEFRs remain in downstate NY.

Figure 1: NPV of Benefits and Costs

⁵ We show the NPV of benefits calculated by NYISO for the P95 Case. This is equivalent to the NPV of benefits in the BVS case summarized in Figure 39 of NYISO's report plus the NPV of additional benefits in the BVS P95 Case reported in Figure 32 of Appendix L of NYISO's report. In the "P95, MMU Discount" case we use the benefits estimated by NYISO, but correct for an issue with discounting that causes the NPV presented by NYISO to be understated (see Section IV.A.2).

⁶ Section IV.B discusses the NYISO and MMU estimates of avoided costs of dispatchable generation.

⁷ Indeed, the PSC issued an order in CASE 15-E-0302 on May 18, 2023 inviting comments and announcing a technical conference to discuss what technologies might be considered zero-emissions for purposes of the 2040 mandate. The order solicits comments on the following technologies: advanced nuclear, long-duration storage, green hydrogen, renewable natural gas, and carbon capture and sequestration.

Production Cost Savings. We show larger production cost savings because we adjust for the tendency of the hourly GE-MAPS production cost model to underestimate congestion that occurs under actual market conditions. See Section IV.D.

Cost of Projects. Our calculation includes costs of O&M and financing during construction for the new transmission project. These are major cost elements for each of the new transmission projects and omitting them significantly understates the true costs of the projects.

Taken together, the lower benefits and higher costs in our assessment of the projects accounts for the reduction in the B-C Ratio for T051 of 34 percent. Figure 1 also shows our estimate of the overall Benefit-Cost Ratio of 1.04 for project T048. Our estimated B-C Ratio is higher for T048 (than for T051) because it has much lower capital costs, but only slightly lower benefits. In contrast, the NYISO evaluation of benefits would result in a lower B-C Ratio for T048 than for T051 primarily because it estimates higher avoided costs for dispatchable generating capacity investment for T051 than for T048. Overall, in consideration of the recalculated quantitative metrics, we find that T048 appears to be a more cost-effective project than T051.

The benefits of new transmission vary considerably during the study period, so Figure 2 shows annualized costs and benefits amortized over the first 20 years of investment in 2030, 2035, 2040, and 2045. This is provided for T051 and T048 both with and without the Empire Wind II generator at its proposed point of interconnection. This highlights several key findings. First, the annual benefits from the projects would be very low relative to the annualized costs in 2030 and 2035. The production cost savings rise sharply in 2040 for reasons that we discuss below.

Second, most of the benefits in 2030 are contingent on the status of the Empire Wind II generator. If Empire Wind II does not proceed with construction, builds its own upgrade to become deliverable, or simply moves to a less constrained point of interconnection, most of the benefits would be lost in the initial years of the study period. This highlights the substantial uncertainty associated with these early benefits.

Third, our estimated benefits rise significantly over time making both projects appear cost-effective by 2040 when the State would become much more reliant on Dispatchable Emission Free Resources (“DEFR”). This occurs because DEFRs are assumed to have a relatively high marginal cost (\$150 per MWh) compared to conventional resources. Therefore, every MWh of avoided offshore wind curtailment saves \$150 per MWh in 2040 when DEFRs are assumed to be on the margin. This benefit is extremely uncertain because some zero carbon technologies are likely to be developed that have much lower marginal costs, such as small modular nuclear reactors. A mix of resources could be developed (e.g., carbon capture for conventional resources or green hydrogen technology) with a range of fixed and variable costs. To the extent that the future resource mix relies more on lower variable cost resources, the estimated production cost savings would fall sharply and the B-C Ratio for both projects would likely be less than 1.0 over the entire study period.

(ii) Implied Net REC Cost

This report also estimates the relative costs of producing more renewable energy through alternative investments using the INREC Cost metric. The two proposed transmission investments are the first two alternatives that would facilitate more renewable energy by reducing curtailments. We also estimate the INREC cost for generic alternative investments in renewable generation and battery storage. Since the PPTN is to facilitate the installation of offshore wind on Long Island, we also show the impact of the recommended transmission project on the INREC cost of generic offshore wind on Long Island. Figure 3 shows these estimates every five years during the study period, which highlights several factors. First, the INREC Cost of T048 is significantly lower than that of T051 throughout the period.

Second, the costs of increasing output from renewables by investing in T051 or T048 are significantly higher than the cost of investments in additional renewable resources or battery storage in 2030 and 2035. The transmission projects become more cost-effective by 2040 because of the sharp increase in production cost savings caused by reliance on DEFRs, thereby reducing the INREC Cost of transmission.

Figure 3: Implied Net REC Cost

Third, the INREC Cost of battery storage is less than zero during the study period, indicating that investments in battery storage would be cost-effective even without any compensation for increasing renewable production by reducing their curtailment. This suggests that the NYISO modeled inefficiently low levels of battery storage penetration and that a substantial amount of additional battery storage could be used to reduce offshore wind curtailments on Long Island at a much lower cost than building transmission. However, additional simulations would be needed to determine how much more battery storage penetration would have been cost-effective.

Fourth, the proposed transmission projects have no effect on INREC Cost of generic offshore wind on Long Island in 2030, and only a relatively small effect from 2035 through 2045. This indicates that they would provide only modest benefits in facilitating additional offshore wind.

Hence, we find that increasing renewable generation by investing in one of the proposed transmission projects would provide no significant benefits to generic offshore wind in Long Island in 2030, and the transmission projects would not be cost-effective until after 2035. In 2040, they would only be cost effective if the system would otherwise rely on DEFRs with relatively high dispatch costs as discussed above. If the system does not come to rely exclusively on DEFRs with high dispatch costs, but a mix of technologies evolve including some with moderate to low dispatch costs, the transmission projects would likely remain uneconomic throughout the study period. One of the costs of investing in transmission projects that are not economic is that they tend to crowd-out other more cost-effective investments.

(iii) Reducing Curtailment of Offshore Wind Generation

Without the proposed transmission projects, the Policy+B-VS+P95 Scenario shows 2.5 TWh or 25 percent of Long Island offshore wind curtailed in 2030 and 2.4 TWh in 2035, rising to 4.5 TWh in 2040. The Empire Wind II project accounts for a disproportionately large share of Long Island offshore wind curtailment – 93, 77, and 15 percent in 2030, 2035, and 2040, respectively.⁸ Given that most of the reductions in offshore wind curtailment is of the Empire Wind II project before 2040, the benefits of both projects in the early half of the study period are highly dependent on whether the Empire Wind II facility is built and whether it maintains its currently planned interconnection point. As both projects are well over \$2 billion in total costs, moving the interconnection point or otherwise mitigating the impact of this project would be valuable.

Observations Regarding the Public Policy Transmission Need Defined by the PSC

The New York PSC order defining the PPTN stated that the goals of the CLCPA constitute a Public Policy Requirement. The CLCPA mandates 70 percent renewable generation by 2030, 9

⁸ These values reflect curtailment in the BVS P95 case based on production cost model data provided by NYISO. We estimate the portion attributable to Empire Wind II based on the difference in total curtailment between the BVS and non-BVS policy cases. See also Appendix L of NYISO's report.

GW of offshore wind capacity by 2035, and zero emissions from electricity by 2040. The PPTN order calls for upgrades to local and interzonal transmission between Long Island and neighboring zones to allow up to 3 GW of offshore wind on Long Island to be fully deliverable.

While the PPTN provided no specifics regarding the timing of new transmission investment, the most relevant element of the Public Policy Requirement is the 2035 goal of 9 GW of offshore wind, assuming one-third would interconnect on Long Island. Accordingly, the NYISO's Baseline and Policy Cases model 3.1 and 3.7 GW of offshore wind on Long Island, and a total of 9 and 9.7 GW for the State in 2035. This grows to 6 GW on Long Island and 12 GW statewide in the Policy Case in 2040. The NYISO study includes numerous modeling details that reveal the impact of the proposed transmission projects on satisfying the 2030, 2035, and 2040 goals.

The NYISO analyses suggest that while the proposed transmission projects are cost-effective by 2040 and would help satisfy 2035 offshore wind mandate, they provide little benefit before 2035. In 2030, both T051 and T048 would crowd-out more cost-effective investments in solar PV generation and battery storage, increasing the cost of satisfying the 2030 mandate.

In the initial phase of the study, a large share of the transmission benefits would accrue to the developer of the Empire Wind II project because it would be able to avoid a significant amount of interconnection costs that would otherwise be its responsibility under its long-term PPA with NYSERDA. When transmission expansion is not anticipated until after a contract is awarded to a specific generation developer, the transmission expansion will result in a financial windfall for the generation developer, which could be addressed in the cost allocation.

Finally, it would be beneficial for the NYISO to provide additional information on the costs and benefits of generic potential transmission investments before the PSC determines future Public Policy Transmission Needs. This would be valuable partly because uneconomic transmission investment can crowd out more efficient investment that could achieve the State's policy goals at a lower cost and potentially earlier than large-scale transmission.

Conclusions and Recommendations

The recommended project (T051) fulfills the Public Policy Transmission Need that was defined by the PSC and contributes towards meeting the goals of the underlying Public Policy Requirement of connecting 9 GW of OSW by 2035. However, it would provide little benefit before 2040 and increase the cost of satisfying the 2030 mandate of satisfying 70 percent of load with renewable generation. The T048 project exhibits a significantly higher benefit-cost ratio, but it is similarly uneconomic before 2040.

For example, we estimate both projects to have a benefit-cost ratio close to 0.1 in 2030 if the Empire Wind II project is not built or relocates. Although the benefits rise if the Empire Wind II project proceeds at its current location, the benefit-cost ratio remains well below 1.0 and most of

the added benefits would accrue to the Empire Wind developer since it is already under contract with NYSERDA and the costs and savings of the project will not affect the contract price.

Given the poor economics of these projects in these early years, they would undermine incentives for lower-cost clean energy investments or energy storage that could reduce offshore wind curtailments at a much lower cost. While both T051 and T048 become cost-effective by 2040, the benefits depend on highly speculative assumptions about the costs and operating characteristics of future dispatchable generation investments. The NYISO assumed DEFRs have high capital costs and variable costs, very flexible characteristics, and that they do not withdraw electricity from the power system to generate fuel. However, the estimated benefits would be significantly lower in 2040 if the NYISO assumed that future dispatchable generators:

- Consume surplus electricity to create renewable fuel – If DEFRs are fired by fuel synthesized from surplus renewable output that would otherwise be curtailed, it would reduce the estimated benefits of the transmission projects.
- Have lower variable production costs – The NYISO assumes DEFRs will have high capital costs (with large regional variations) and high variable costs. If technologies emerge with lower variable costs, the sharp increase in benefits in 2040 and beyond will be reduced or eliminated.

Ultimately, the proposed transmission projects are not estimated to be helpful for satisfying the 2030 mandate and they would make relatively modest contributions toward satisfying the 2035 mandate. Furthermore, the majority of the benefits of new transmission over the study period depend on the future costs and characteristics of DEFRs, which will likely be clarified in the coming years. In addition, investment in storage could be used to satisfy the 2030 and 2035 mandates more cost-effectively if it is not crowded-out by the new transmission. Given the estimated investment lead time of around six years and small benefits before 2040, it is premature to move forward with a capital-intensive transmission project at this time. These results support the following conclusions and recommendations:

- It is not advisable to move forward with one of the proposed transmission projects at this time given the magnitude and timing of the potential benefits. This process could be re-initiated in future years if warranted.
- If the NYISO determines that it must or should select a project, we recommend that it reconsider its recommendation of T051 since it does not appear to be the most cost-effective project.
- We recommend that the NYISO provide initial estimates of costs and benefits of generic potential transmission solutions to the PSC to inform future PPTN determinations.

In addition to these recommendations, we identify recommended improvements to the NYISO's evaluation process and analysis in Section IV. In general, we found the NYISO's methodologies

Executive Summary

for this assessment are reasonable. However, we identify several methodological enhancements for NYISO to consider in future public policy transmission evaluations.

A complete set of recommendations is provided in the Section V of this report.

II. PRINCIPLES FOR THE EVALUATION OF MARKET EFFECTS OF PROJECTS

The purpose of the PPTP process is to identify transmission investments that would provide significant public policy and wholesale market benefits. However, it is critical for the PPTP process to function in a manner that supports the NYISO's competitive wholesale markets. This section discusses the principles we use for evaluating the qualitative and quantitative benefit metrics against the estimated costs of proposed projects and ensuring that the PPTP process does not undermine the wholesale market.

Transmission upgrades can provide many wholesale market and public policy benefits to the system, including:

- Increasing the utilization of low-cost generation, which lowers production costs; and
- Satisfying public policy objectives, such as reducing environmental emissions by facilitating increased development and dispatch of lower-emitting resources.

To assess the value of a proposed transmission project, it is important to fully quantify these benefits to determine whether the project is efficient.⁹ The NYISO's economic transmission planning process does not consider several key wholesale market benefits and public policy benefits. This is partly why no transmission project proposal has ever been deemed to be cost-effective in the economic planning process. The PPTP process allows the NYISO to consider additional benefits for a more complete assessment of whether a proposed project is efficient.

In Section III.A of this report, we discuss a framework for quantifying the different categories of wholesale market and public policy benefits. This framework includes cost savings, reliability benefits, and environmental impacts that assist in evaluating the impact on wholesale electricity markets from the proposed projects. Section III.B provides the results of the Benefit-Cost Ratio metric which indicates whether the proposed project would enable policy mandates to be met at a lower overall cost than alternative investments. In addition, the Implied Net REC Cost is calculated for each investment to determine whether the recommended project is more cost-effective in increasing the deliverability of renewables than alternative clean energy investments.

Although reducing transmission congestion will always produce benefits, these benefits must exceed the costs of the transmission project to conclude that the project is efficient compared with alternative investments. Inefficient transmission investment can distort wholesale prices, crowd-out efficient private investment, and ultimately increase the cost of satisfying public policy objectives.

Therefore, our criteria for determining that a public policy transmission project is efficient for purposes of this evaluation is: *the benefits of the project exceeds its costs*. For projects that are

⁹ We recognize that some of the public policy benefits are subjective and may not be quantified easily.

effective in facilitating renewable generation, this generally occurs when the Implied Net REC Cost of transmission is lower than alternative clean energy investments.

Projects that do not satisfy this general principle will undermine the markets and ultimately raise costs to consumers in New York. Therefore, we evaluate the costs and benefits of each of the proposed projects, which includes a review of the assumptions used to estimate the projects' benefits. We then apply this principle to determine whether the project recommended for selection by the NYISO would adversely affect the NYISO's wholesale electricity markets.

III. EVALUATION OF PROPOSED TRANSMISSION PROJECTS

The NYISO presented several quantitative and qualitative metrics of the impacts and costs of each project and outlined how these metrics were ultimately considered in its recommended selection of Project T051. While estimates of cost and economic value are relatively straightforward to interpret, it can be difficult to evaluate metrics that are either qualitative or quantified in non-dollar terms. This section discusses: (i) our approach to quantifying the economic, environmental, and reliability benefits that would be provided by each project; (ii) the results of the evaluation; and (iii) a discussion of the other quantitative benefits of the each project.

A. Metrics for Evaluating Costs and Benefits

The NYISO employed a diverse set of metrics for satisfying the PPTN, which can be used to derive the economic, environmental, and reliability benefits that would come from the recommended transmission projects. The principle quantitative benefits include:

- *Production Cost Savings* – the projects are expected to reduce system production costs by relieving transmission congestion, allowing lower-cost resources to serve load. For the Long Island PPTN, production cost savings result both from unbottling offshore wind generation on Long Island and from allowing more energy imported from upstate to displace higher-cost generation on Long Island. The incremental production cost savings from unbottling Empire Wind II are reported separately.
- *Avoided Cost of Investment in Capacity Needed for Reliability* – Projects increase transfer capability into Long Island, potentially reducing the amount of generation capacity that must be maintained there to satisfy reliability criteria. This may result in cost savings if the PPTN projects allow capacity needed to satisfy the state’s Installed Reserve Margin to be built in lower-cost upstate areas instead of higher cost downstate ones.¹⁰
- *Avoided Cost of Investment to Satisfy State Policy Goals* – New York’s electric sector is required by law to be 70 percent renewable by 2030 and 100 percent zero-emissions by 2040. To meet these targets, many renewable generation investments will be required in addition to the mandated 9 GW of offshore wind. By reducing curtailment of offshore wind, the PPTN projects would reduce the amount of renewable capacity or RECs the state will need to procure from other sources in order to meet its targets. This approach captures the climate policy benefits of the PPTN projects because it indicates how much they will reduce the cost of achieving the 2030, 2035, and 2040 mandates compared to

¹⁰ In our report on the previous PPTN evaluation for the AC Transmission Projects, we also recommended that NYISO quantify the benefits of more reliable service. We recommended measuring this as the reduction in loss of load expectation (LOLE) provided by the projects, valued at the cost of obtaining the same reliability improvement in the capacity market. The NYISO performed an analysis of the projects’ LOLE reduction benefit (Appendix M of NYISO’s report), but the NYISO’s analysis includes key methodological flaws, such as beginning from a base case system set to at-criteria (i.e., LOLE equal to 0.1 days per year) conditions instead of a level that would be consistent with its modeled conditions. Nevertheless, we expect that the LOLE benefits from the proposed projects would be relatively small in this solicitation (if estimated appropriately).

alternative means.¹¹ The portion of avoided costs that are contingent on unbottling Empire Wind II are reported separately.

The three benefits above can be added together to estimate a total project benefit encompassing economic, reliability, and public policy value in dollars terms. We also evaluated the following key project benefits that are not directly additive these:

Offshore Wind Curtailment Reduction – This is a key benefit because reducing offshore wind curtailment is the stated purpose of the PPTN. It should be noted that the value of reduced curtailment is effectively contained in the economic benefit metrics described above. This is because the value of increased deliveries of offshore wind lies in (1) lower production costs, and (2) public policy benefits in the form of increased zero-emissions generation that would otherwise need to be procured from another source. Hence, a benefit-cost analysis based on the three principle benefits described above implicitly values the degree to which the proposed projects successfully achieve the PPTN.

Implied Net REC Cost – The PPTN process is designed to identify transmission investments that advance New York State policy goals. There are many potential transmission, generation, and storage projects that can contribute to New York’s clean energy targets. NYISO markets indicate the value of competing solutions and provide incentives for the most efficient projects to come forward. To avoid crowding-out more cost-effective solutions, an efficient PPTN solution should advance Public Policy Requirements (such as an increase in offshore wind energy or total clean energy) at lower cost than other generic investments that provide comparable contributions towards those goals. The Implied Net REC Cost metric assesses the efficiency of the proposed transmission projects by quantifying the net cost per unit of renewable energy it provides.

B. Evaluation of the Proposed Public Policy Transmission Projects

We have reviewed results of modeling performed by NYISO for the recommended project. We modified these results to account for key factors affecting project benefits and costs that NYISO did not consider in its evaluation, discussed in detail in Section IV. Using these results and the project costs presented in the NYISO report, we compared total expected benefits of the T051 project to its total costs. In addition, we also evaluate the benefits and costs of Project T048 because it was the lowest-cost project among the top-tier. This subsection discusses the results of our benefit/cost analysis and compares it to NYISO’s results.

Figure 4 and Figure 5 show our estimated benefits and costs for projects T051 and T048 over the 20-year evaluation period. Project costs are shown on a levelized basis. Overall, we estimate

¹¹ While the NYISO quantified CO2 emissions reductions resulting from the projects, the results are not impactful in this evaluation because the NYISO system is assumed to reach a state of zero emissions with or without the PPTN projects. Hence, the climate policy benefits of the PPTN projects stem from their ability to help achieve the zero emissions target at lower cost than if they were not built.

that T051 would produce benefits significantly below its costs until the late 2030s, when benefits would begin to exceed costs. On the other hand, we estimate that T048 would begin to produce benefits consistent with its costs two years earlier.

Figure 4: MMU Estimated Annual Benefits and Costs of T051 Project

Figure 5: MMU Estimated Annual Benefits and Costs of T048

Production cost savings are the largest source of long-term benefits for both projects. For the first five years of the evaluation period, these would be expected to be come mainly from reducing curtailment of the planned Empire Wind II offshore wind facility by reducing

congestion on the Barrett – Valley Stream 138 kV line.¹² The developers of Empire Wind II recently rejected transmission upgrades identified in NYISO’s interconnection process that would have increased its deliverability, with an estimated capital cost of \$265 million. The NYISO did not evaluate whether the Empire Wind II interconnection upgrades alone would have achieved the PPTN’s goal of allowing 3 GW of offshore wind to be deployed on Long Island.

In the long-term, production cost savings are expected to increase because of: (1) assumed deployment of 6 GW of offshore wind on Long Island by 2040 in NYISO’s policy case, and (2) a large increase in the cost of dispatchable energy as existing fossil units are replaced by dispatchable emissions free resources (“DEFERs”). DEFERs are assumed to have much higher variable costs than conventional generation. Because DEFERs are unknown technologies with assumed costs, the production costs savings later in the study period are highly uncertain.

Overall, our estimates of the NPV of benefits are significantly lower than the NYISO estimates. This is primarily because NYISO’s evaluation did not adequately consider key factors that would limit the avoided capacity investment costs of the proposed projects. Notably, NYISO did not evaluate whether upstream transmission bottlenecks would limit the amount of generation capacity that could be held in upstate New York instead of Long Island. In our evaluation, we found that nearly all of the avoided capacity investment benefit estimated by NYISO cannot be realized without upgrading key upstream constraints that are not addressed by the PPTN projects.

We estimate a higher NPV of production cost savings and avoided public policy costs than NYISO after we adjust for aspects of NYISO’s modeling that are likely to understate them. Our changes include (i) an adjustment to account for the general downward bias in production costs estimated using hourly production cost models such as GE MAPS, and (ii) inclusion of fixed O&M and local transmission upgrades in the avoided costs of renewable investments. We also include estimated life cycle O&M costs of the proposed transmission projects, which NYISO did not include in its NPV estimates. As a result, we find that the recommended project (T051) has an expected Benefit-Cost Ratio of 0.81, while the lower-cost alternative (T048) has a B-C Ratio of 1.04. It is important to note that these estimates include the project’s contribution to meeting New York’s clean energy goals, which are quantified through the avoided policy savings benefit.

The long-term benefits of the recommended project and our preferred alternative are highly uncertain, especially in the years following the state’s zero emissions electricity mandate. This is because the production and investment cost savings estimated by NYISO are primarily driven by the avoided cost of building and producing energy from DEFERs, a technology that is currently unspecified. Additionally, the NYISO did not thoroughly analyze key factors affecting project benefits, including the impact of upstream transmission constraints and the impact of operating reserve requirements on production cost savings.

¹² We estimated the production cost savings attributable to unbottling of Empire Wind II as the difference in savings between NYISO’s GE-MAPS cases with and without the Barrett-Valley Stream constraints modeled.

C. Other Quantitative Measures of Impact

This subsection discusses results of benefit metrics that complement the benefit-cost ratio presented above.

1. Offshore Wind Curtailment

Figure 6 summarizes the T051's impact on annual renewable curtailment based on NYISO's GE MAPS results.¹³

Figure 6: Impact of Projects on Curtailment of Offshore Wind and Other Renewables

In NYISO's 2030 and 2035 cases, the vast majority of offshore wind energy unbottled by T051 results from relieving congestion on the Barrett-Valley Stream facility limiting output from Empire Wind II, instead of from expanding Long Island's export capability. T051 partially resolves the constraint affecting Empire Wind II, which experiences 46 to 49 percent curtailment in the pre-project case and 19 to 21 percent curtailment in the project case. In 2040 and beyond, T051 is expected to eliminate more curtailment because of the assumed deployment of 6 GW of offshore wind on Long Island. T048 exhibits somewhat smaller impacts on curtailment of offshore wind over the study period.

¹³ The height of the bars in Figure 6 reflect the total difference in offshore wind curtailment between the base and project case versions of NYISO's Policy Barrett-Valley Stream CRM Case MAPS simulations. Net curtailment is calculated as the difference in offshore wind curtailment less the difference in curtailment of land based wind, solar, hydro and hydro imports in NYISO. We estimate the portion of avoided curtailment attributable to Empire Wind II based on the increase in avoided curtailment in the Barrett-Valley Stream case compared to the case in which this constraint is not modeled, using data reported in Figures 8 and 9 of Appendix L of NYISO's report.

Beginning in 2035, the offshore wind unbottled by the T051 project causes curtailment of other renewable resources (including wind, solar and hydro) in other parts of the state. Approximately one-third of the offshore wind unbottled after 2035 causes curtailment of other renewable resources.¹⁴ We use this ‘net’ impact on curtailment to calculate the Implied Net REC of the proposed projects below.

2. Implied Net REC

The Implied Net REC (“INREC”) Cost is the average cost of increased renewable production resulting from the new transmission project (after netting out the value of wholesale market benefits). This is used to compare the net cost of a transmission investment to unbottle renewables with REC program costs and/or the net cost of energy storage projects that reduce curtailment of renewables. When the INREC Cost is lower for a transmission project than for competing investments in renewable generation or battery storage, the transmission project is cost-effective. However, if the INREC Cost is higher, then the transmission project is likely to crowd-out other more economic clean energy investments.

Figure 7 compares the estimated INREC Cost of the T051 and T048 projects over the evaluation period to alternative investments in renewables.¹⁵ The T051 and T048 INREC Costs are estimated using the benefits and net curtailment reductions discussed above. The INREC Costs of renewables and storage are estimated using NYISO’s policy base case, which does not include the proposed transmission projects.¹⁶ NYISO did not model local transmission constraints in upstate regions that would impact energy deliverability and revenues of renewables there, so we include in the renewable INREC cost the estimated cost of local transmission upgrades based on

¹⁴ This finding is based on data for the BVS P095 case provided by NYISO. See also figures 18 and 19 of Appendix L of NYISO’s report.

¹⁵ The INREC cost of the transmission project is estimated as its levelized cost net of annual production cost savings and avoided capacity investment benefits, divided by the annual net reduction of renewable curtailment it provides. The INREC Costs of renewables are estimated as the levelized cost per megawatt of an additional unit of that technology net of estimated market revenues in the production cost model base case, divided by the annual net increase in renewable generation it provides (e.g. its annual output excluding hours when the resource would be curtailed or cause another renewable resource to be curtailed). The INREC cost of storage is estimated as the levelized cost of a 1 MW, 4 Hour battery on Long Island net of expected energy, ancillary services and capacity revenues, divided by the incremental MWh of renewable energy the battery would provide each year by charging to reduce renewable curtailment. Since this is a comparative metric of the cost of procuring a REC, we exclude avoided policy investment costs (which are equivalent to avoided REC costs) from the calculation of the PPTN project INREC Cost and exclude the negative portion of LBMPs from the calculation of renewable and storage INREC Costs.

¹⁶ We exclude federal ITC and PTC incentives when calculating the levelized cost of renewables, so that the INREC cost represents the total social cost of obtaining a REC. We calculate INREC Cost for a land-based wind project in Zone C and the average of solar PV in zones C and F.

projects recently approved by the NYPSC.¹⁷ We also show the incremental curtailment rate of each renewable resource, which is considered in the INREC calculation. For example, an additional offshore wind project on Long Island in 2035 would face curtailment of 21 percent of its output, and the INREC cost of its remaining deliverable energy after accounting for this curtailment is \$75 per MWh.

Figure 7: Implied Net REC Cost of T051, T048, and Generic Investments

The INREC cost of T051 is initially very high (~\$212 per MWh in \$2022 in 2030) because it has low expected economic benefits relative to its costs during that period. This indicates that T051 is a very costly means to increase the supply of renewable energy during this period compared to investing in additional renewable capacity, even after accounting for partial curtailment of the renewables. The INREC Cost of T048 is significantly lower but remains higher than other technologies until around 2038. In 2040 and beyond, the INREC cost of the proposed transmission projects falls rapidly because it is projected to provide much greater production cost benefits (reducing its net cost) and reduce more offshore wind curtailment. This suggests that

¹⁷ See February 16, 2023 *Order Approving Phase 2 Areas of Concern Transmission Upgrades* in NYPSC Docket 20-E-0197. We estimate local transmission costs based on the levelized value of the estimated \$4.4 billion cost of the approved Phase 2 upgrades divided by the 30,332 GWh of energy deliverability headroom they are expected to provide. There is still significant curtailment of renewables in NYISO's model results because of the presence of inter-zonal high voltage bottlenecks, but this is already reflected in the INREC Cost calculation through the incremental curtailment rate.

T051 would not be a cost-effective way to increase the supply of RECs (compared to investing in additional renewable capacity) until 2040.

We calculate an INREC Cost of \$0 per MWh for storage on Long Island in NYISO's Policy Case. This suggests that it would be economic for additional storage to enter the market and reduce curtailment of offshore wind by charging to absorb curtailed wind energy.¹⁸ In the pre-project case, an incremental megawatt of battery capacity with 4- or 8-hour duration would reduce curtailment by approximately 979 to 1,819 MWh per year if located at the Barrett substation, or 430 to 670 MWh per year by 2035 and 762 to 1,343 MWh per year by 2040 if located elsewhere on Long Island.¹⁹ The net cost of batteries is low because of high energy and capacity revenues in the Policy Case, even after accounting for declining marginal capacity value of storage. These results suggest that both the T051 and T048 projects may crowd out storage investments that could more cost-effectively reduce curtailment of offshore wind.

¹⁸ This may also indicate that the NYISO's capacity expansion model is building less than the optimal amount of battery storage capacity. This may be due to the tendency of storage resources to profit from price volatility and the difficulty of modeling price volatility in the NYISO's capacity expansion model, which models time in larger chunks than an hourly or interval-level model.

¹⁹ We estimate incremental avoided curtailment a storage unit could provide using GE-MAPS data provided by NYISO. Storage is assumed to reduce curtailment when it would economically charge during hours where the LBMP is zero or less.

IV. KEY ASSUMPTIONS USED TO ESTIMATE BENEFITS AND COSTS

This section discusses key assumptions used in the NYISO's estimates of the costs and benefits of the proposed projects. We also discuss several factors that were not considered in the NYISO's estimates. Ultimately, we find that the overall effect of addressing these factors would likely be a significant reduction of the overall benefit-cost ratios for the recommended projects. We recommend the NYISO address these issues in future evaluations.

Subsection A discusses the estimation of individual transmission project costs. Subsection B addresses the NYISO's assumptions regarding avoided costs of dispatchable generation needed for reliability. Subsection C addresses NYISO's estimate of the avoided cost of satisfying state policy mandates. Subsection D evaluates the assumptions used in the production cost simulation model.

A. Factors Affecting Transmission Investment Costs

This section reviews the NYISO's approach to estimating project costs and describes alternative assumptions used in our analysis.

1. Exclusion of Operating and Maintenance Costs and AFUDC

NYISO's evaluation considered only the proposed projects' overnight capital costs. It did not consider operating and maintenance (O&M) costs or allowance for funds used during construction (AFUDC), which can significantly affect a transmission project's total life cycle cost.²⁰ For example, in the last PPTN evaluation (the AC Transmission Projects evaluation completed in 2019), data provided by the NY Department of Public Service and the Brattle Group indicated that O&M costs would add approximately 39 percent to the net present value of the project's costs over a 45-year period and AFUDC would add over 9 percent.²¹

In our evaluation, we accounted for AFUDC by assuming funds will be committed for an average of two years (based on construction timelines estimated by NYISO's independent consultant) at a real weighted average cost of capital of 5.1 percent, resulting in a 10.5 percent increase in the project's capital cost above the overnight estimate in real terms.

Estimating O&M costs is challenging in the absence of information provided by developers. It is likely not possible to extrapolate O&M estimates used in the AC Transmission process, which reflected projects consisting mainly of overhead lines in upstate New York. A large portion of the T051 and T048 projects consist of new underground and submarine transmission cables,

²⁰ See section 3.2 of NYISO's report.

²¹ See slides 4 and 5 of the Brattle Group's October 8, 2015 presentation on *Benefit-Cost Analysis of Proposed New York AC Transmission Upgrades* in NYPSC Case 12-T-0502.

which have different maintenance profiles compared to overhead lines. Based on the O&M costs reported per circuit-mile of underground lines and per substation in FERC Form 1 filings of downstate utilities, we conservatively estimated annual O&M costs to be approximately 0.5 percent of overnight capital costs for the T051 and T048 projects. However, we recommend that the NYISO estimate these savings as part of its evaluation in future PPTP evaluations.

2. Capital Costs and Discounting

NYISO considered two estimates of the overnight cost of each project: one based on the voluntary cost cap submitted by each developer, and one developed by NYISO's independent consultant. For the T051 and T048 projects, NYISO estimated overnight capital costs of \$3.26 billion and \$2.12 billion by adjusting the developer's cost cap using the independent consultant's estimate. These costs are expressed using 2022 prices.²²

It is important to discount costs and benefits that take place at different times in a consistent manner. NYISO's evaluation used the following parameters and assumptions: (1) the project is assumed to enter service in 2030, (2) benefits are evaluated over a 20-year time horizon (2030 to 2049), (3) benefits are discounted using a 7.1 percent discount rate intended to reflect a regulated utility cost of capital, and (4) all values are presented in 2022 dollars. NYISO discounted project benefits to 2022 using the 7.1 percent discount rate, instead of discounting to the initial year of the evaluation period (2030). For production cost benefits, NYISO estimated savings at five year intervals (2030, 2035, 2040, and 2045) and assumed that savings are the same in nominal terms between intervals (e.g. the same value for 2030 through 2034).

In our evaluation, we discount future benefits to 2030 using NYISO's 7.1 percent discount rate. We apply a 2 percent annual inflation escalator to NYISO's 2022\$ capital cost estimate to estimate its nominal cost in 2030. We express annualized project costs as a levelized value over 20 years based on the cost estimate as of 2030. Hence, project costs and benefits are uniformly discounted to the same date. We present our results in 2022\$ by applying a 2 percent annual inflation deflator to 2030 present values. We also interpolate production cost savings benefits for years between model run years. In Figure 1, we calculate the NPV of benefits estimated by NYISO using this discounting approach, so that the NYISO's benefit-cost ratio can be compared directly to ours.

B. Avoided Cost of Investment in Dispatchable Capacity Needed for Reliability

The proposed transmission projects would increase transfer capability into Long Island, potentially reducing the amount of capacity needed in Long Island and other downstate areas to maintain reliability. In the long term, this would reduce system costs by allowing peaking capacity to be built or maintained in upstate areas where it is less expensive instead of Long

²² See section 3.2 of NYISO's report.

Island. In NYISO's evaluation, this is the largest benefit of the T051 and T048 projects and accounts for the majority of their values on a NPV basis.²³

We identify two flaws in NYISO's evaluation that cause the avoided cost of capacity benefits of T051 and other proposed projects to be significantly overstated. First, NYISO did not consider whether upstream transmission constraints not addressed by the projects would limit the impacts on Long Island's capacity requirements. Second, NYISO adopted speculative assumptions regarding the cost of future peaking plants that result in extremely high cost savings for each megawatt that can be shifted from Long Island to upstate. We discuss these flaws below.

1. Effect of Upstream Transmission Constraints

NYISO quantified the increase in potential transfers into Long Island provided by each proposed PPTN project. NYISO then assumed that an amount of capacity proportional to this increase can be held in upstate New York instead of Long Island if the project is built.²⁴ This analysis is incomplete because NYISO did not evaluate whether upstream constraints other than those directly upgraded by the project would limit the ability to remove capacity from Long Island in a resource adequacy planning assessment.

Shortcomings of NYISO's Approach

NYISO estimated the PPTN projects' impacts on the Long Island capacity requirement by replicating only one component of its methodology to determine Locational Capacity Requirements (LCRs). NYISO determines LCRs each year so that the capacity market will procure enough supply in each region to satisfy reliability criteria, considering major transmission bottlenecks and the cost of new supply in each area. NYISO's LCR Optimizer process determines LCRs using GE-MARS, a probabilistic model that considers the ability of the transmission system to move power throughout the entire NYCA region during peak conditions. NYISO also calculates minimum LCR floors based on Transmission Security Limits (TSLs), which consider contingencies that would affect transfers on facilities directly into each region. The LCR is the higher of the values determined by the Optimizer and TSL approaches.

NYISO's evaluation determined that the PPTN projects would cause the TSL-based requirement in Long Island to fall by adding new transfer capability directly onto the island from nearby areas. The proposed PPTN projects are generally designed to increase the transfer capability between Long Island (Zone K) and the Con Edison service territory in Westchester County (Zones H and I). Some projects, including T051, also upgrade transfer capability between Long Island and New York City (Zone J).

²³ See Figures 38 and 39 of NYISO's report.

²⁴ See Appendix N of NYISO's report.

NYISO assumed without any analysis that the LCR in Long Island will fall by the same amount as the reduction in its TSL-based requirement. This ignores the fact that the LCR Optimizer considers many other transmission constraints that may limit flows between the upstate region and Long Island. If upstream bottlenecks restrict the ability of additional upstate capacity to serve downstate New York, an increase in the transfer limit to Long Island from other downstate areas will not allow more capacity to be held upstate unless those upstream constraints are also upgraded.²⁵ Figure 8 below shows a simplified representation of the location of key constraints impacting flows between upstate and downstate New York.

Figure 8: Illustration of Upstream Transmission Constraints

These constraints include the UPNY-CONED constraint (between zones G and H) and the UPNY-SENY constraint (between zones A through F and zone G). The proposed transmission projects would increase transfer capability between Long Island and other zones within the H-K group, but none of them would increase transfer capability across UPNY-CONED or UPNY-SENY interfaces. However, (though NYISO did capture these interface limits in the capacity expansion and production cost models) the NYISO did not use its resource adequacy model to

²⁵ NYISO used a zonal capacity expansion model that includes upstream transmission limits. However, the presence of these constraints in the capacity expansion model does **not** allow it to usefully quantify their impact on zonal capacity requirements. The capacity expansion model is not designed to determine capacity requirements internally. It uses an average load forecast and groups hourly load and resource availability into multi-hour “time slices” that average across multiple hours, so it does not simulate probabilistic hourly net peak load conditions affected by load forecast uncertainty as is done in a resource adequacy model such as GE MARS. Capacity requirements derived from MARS are driven by the individual hours of highest load, greatest resource unavailability and load forecast uncertainty. Hence, NYISO’s capacity expansion tool simply models fixed zonal capacity requirements that are defined by user input and assigns each resource type an assumed contribution towards those requirements. In this evaluation, NYISO derived the inputted project case zonal capacity requirements from its analysis of TSL based limits discussed in this section.

assess whether the UPNY-SENY and UPNY-CONED interfaces would limit the system's ability to relocate capacity from Zone K to zones A through F.

MMU Analysis of Avoided Capacity Costs

We performed an analysis to examine whether upstream constraints might materially impact the amount of capacity that can be shifted from downstate to upstate by the T051 project. We used a simplified hourly resource adequacy model that considers load, resource availability and transfer limits between NYISO zones, using inputs consistent with NYISO's Policy Case resource adequacy analysis.²⁶ Our model determines zonal capacity requirements designed to satisfy NYISO's resource adequacy criteria using a method comparable to the LCR Optimizer.

Our analysis found that the T051 project would reduce downstate capacity requirements by much less than NYISO's evaluation assumed. NYISO assumed that approximately 2 GW of capacity could be held in zones A through F instead of zone K as a result of the T051 project. By contrast, we found that the UPNY-CONED constraint is likely to bind during the study period, so that little or no capacity can be shifted from downstate to upstate as a result of T051. However, we also found that the project would allow some capacity to be shifted from New York City to Long Island, where it is comparably less costly, providing potential cost savings.

Recent market outcomes support the finding that little or no capacity can be shifted upstate without upgrading UPNY-CONED. The UPNY-CONED interface was binding in the 2020/21, 2021/22 and 2023/24 LCR studies following the retirement of the Indian Point nuclear plant in Zone H.²⁷ This suggests that an attempt to shift significantly more capacity upstream would aggravate this constraint. Table 1 illustrates the significance of UPNY-CONED using assumptions derived from NYISO's 2030 Policy Case.

Table 1 shows that when flows via UPNY-CONED into downstate New York are at maximum levels, the transfer limits from zone I to zones J and K are near binding in the base case, but have

²⁶ NYISO based its analysis in the Policy Case on the 2030 Policy Case conducted for the 2022 Reliability Needs Assessment (RNA), with adjustments to align with the PPTN evaluation. Our resource adequacy tool considers a zonal hourly load forecast based on the Outlook S2 Case, with load forecast uncertainty adjustment based on the 2023/24 IRM Study. It models the renewable resources included in the PPTN Policy Case with hourly capacity factor profiles derived from the Outlook assumptions. We model zonal emergency transfer limits based on the 2026-32 RNA Topology Case (Fig. 25 of the 2022 RNA Appendix), which includes the impacts of the AC Transmission Projects. We also include the Clean Path New York project as a transfer interface between zones A-F and Zone J. We modeled a simplified zones and interzonal limits for the A-F, G, H-I, J and K regions based on the 2022 RNA Policy case plus Clean Path NY.

²⁷ See our Annual Report on the NYISO Markets for 2020 and 2022. The retirement of Indian Point resulted in an increased need for imports from upstate into zones H through K. Beginning in the 2021 capability year, Con Edison made operational changes to certain transmission facilities which increased the UPNY-CONED limit modeled in the IRM study. The UPNY-CONED transfer limit in the IRM study was 7,000 MW in 2021/22 and 2022/23, and 6,675 MW in 2023/24 after Con Edison's operational changes were reverted. The UPNY-CONED transfer limit in the 2030 RNA Policy Case is 7,050 MW.

significant spare capability in the project case. Unfortunately, this spare capability does not allow capacity to be relocated upstate. Hence, our analysis indicates that all or most of the capacity investment benefits estimated by NYISO cannot be realized without also upgrading UPNY-CONED and potentially other interfaces, such as UPNY-SENY. Additional upstream upgrades would substantially increase the cost of realizing any capacity investment savings.

Table 1: Comparison of Downstate Transfers Limits and 2030 Load Forecast

MW		Pre-Project	T051
UPNY-CONED Emergency Limit	(a)	7,050	7,050
Peak Load in zones H and I	(b)	1,830	1,830
Supply in zones H and I	(c)	456	456
Supply Available for Transfer to J and K	(d) = (a) - (b) + (c)	5,676	5,676
Zone I → Zones J and K Emergency Limit	(e)	5,693	7,093
Unused Transfer Capability to J and K	(f) = (e) - (d)	17	1,417

2. Impact of Peaking Plant Cost Assumptions

New York’s Climate Leadership and Community Protection Act (CLCPA) requires the state’s electric system to be zero emissions by 2040. Various studies have shown that a reliable zero emissions system will require a large amount of generation capacity that is dispatchable for long periods and can operate when intermittent renewable output is low. Hence, NYISO began including generic DEFRs in its long term planning studies in 2022.

NYISO’s evaluation considers cost savings from building future additions of peaking capacity upstate instead of on Long Island. All of these savings are in the form of avoided investments in DEFRs, a hypothetical peaking technology assumed to be compliant with state environmental laws.²⁸ Hence, the savings determined by NYISO are driven by the difference in the assumed cost of building a DEFR in Long Island compared to other regions of the state. NYISO assumed that DEFRs will be extraordinarily expensive to build, resulting in apparent cost savings that are highly speculative.

Impact of DEFR Assumptions on NYISO’s Evaluation

NYISO’s evaluation used a base case in which 5.2 GW of DEFR capacity is built in Long Island and 27.2 GW statewide by 2040. All of the avoided capacity investment cost determined by NYISO comes from shifting DEFR capacity from Long Island to zones A through F. NYISO assumed that the capital cost of DEFRs will be \$4,500 per kilowatt in Rest of State and \$5,850 per kilowatt in Long Island (\$2021).²⁹ By contrast, the NYISO’s last Demand Curve Reset study found the capital cost of a dual-fuel H-Frame combustion turbine to be \$1,042 per kW in Rest of

²⁸ See Figures 12 and 13 of Appendix N of NYISO’s report.

²⁹ See Appendix D of NYISO’s 2021 System & Resource Outlook study at p. 7, available [here](#).

State and \$1,158 per kW in Long Island. As a result, each MW of capacity investment that can be shifted from Long Island to Rest of State avoids over 11 times more capital cost under NYISO’s assumptions than it would using current technologies.

As a result, NYISO calculates large investment cost savings because the assumed costs of the generation projects that are shifted upstate are extremely high. In particular, NYISO’s pre-project case includes the addition of 1.7 GW of new DEFR capacity in Long Island built between 2030 and 2035, at a cost of \$9.8 billion (\$2022). NYISO’s project case for T051 allows these DEFRs to instead be built in the Rest of State region in 2037 at a cost of \$7.7 billion (\$2022). This \$2.1 billion difference largely accounts for the capacity saving benefit estimated by NYISO.

Speculative Nature of DEFR Assumptions

The assumed future DEFR costs used in NYISO’s evaluation are highly speculative. NYISO originally contemplated three potential DEFR technologies:³⁰

- *Low capital / high operating cost* technology with a capital cost of \$1,000 per kW roughly equivalent to a combustion turbine burning renewable natural gas,
- *Low operating / high capital cost* technology with a capital cost of \$8,000 per kW roughly equivalent to nuclear, and
- *Medium capital / operating cost* technology whose cost (\$4,500 per kW) is a simple average of the first two options.

In the PPTN evaluation, only the “medium capital / operating cost” option was considered in the capacity expansion model, although this option does not correspond to any known generating technology. Hence, while the DEFR capital cost is a key parameter driving NYISO’s evaluation, its costs and other characteristics are highly speculative.

New York State has not yet issued guidance on what dispatchable technologies will comply with the CLCPA, and there has been little deployment of potentially viable technologies to date. However, peaking technologies are generally chosen to minimize capital costs and it is reasonable to expect that low-capital, high-operating cost technologies will be pursued as demand for non-emitting peaking capacity grows. For example, MIT researchers Hernandez and Gençer (2021) estimate the capital cost of a gas turbine capable of burning hydrogen to be \$1,320 per kW—similar to the “Low capital / high operating cost” technology.³¹

³⁰ See December 17, 2021 NYISO Electric System Planning Working Group presentation “System & Resource Outlook Update” at slide 14, available [here](#). NYISO refers to a study commissioned by New York State that employed a proxy zero emissions technology with costs above those of modern peaking plants, but the ‘medium capital / operating’ DEFR assumption has capital costs 80 percent higher than this technology.

³¹ See Hernandez and Gençer (2021), “Techno-economic analysis of balancing California’s power system on a seasonal basis: Hydrogen vs. lithium-ion batteries”, *Applied Energy* Volume 300, available [here](#).

While green hydrogen is not currently traded as an energy commodity, it may become available in the future at a high price to support something similar to the “Low capital / high operating cost” technology. Additionally, if green hydrogen becomes a traded commodity, then the production of green hydrogen from surplus renewable generation would result in market incentives that could reduce curtailment in a study like the Long Island Offshore Wind Export PPTN evaluation. Hence, there is a wide range of potential technologies that could be viable in the future, and the costs and characteristics of those technologies will have dramatic effects on the mix of transmission, generation, and storage that will be cost-effective in the future.

NYISO’s base case assumes that 27 GW of DEFRs are built by 2040 at a cost of \$150 billion (\$2022), exceeding the combined cost of all of the renewables and storage New York must build to meet its zero emissions mandate.³² It is unclear whether these assumptions are realistic or if they can provide a reasonable basis for major investment decisions at this time.

Conclusions on Avoided Peaking Plant Costs

NYISO’s evaluation vastly overstates the amount of capacity that could be shifted from Long Island to upstate as a result of the PPTN projects by not considering upstream transmission constraints that are not addressed by the PPTN projects. Further, NYISO uses speculative assumptions for the savings resulting from each megawatt shifted.

Consequently, the true capacity savings benefit is likely to be much smaller than NYISO’s estimates. Since the avoided cost of peaking capacity is the largest benefit estimated by NYISO for most proposals, these issues have a major impact on benefit-cost ratios. Overestimating avoided capacity savings will bias the selection process in favor of less efficient projects that provide larger increases in the Long Island import transfer limit.

In our evaluation, we make the following adjustments to estimate avoided cost of peaking capacity. As a result, we estimate avoided peaking capacity benefits that are much smaller than NYISO’s estimates:

- We estimate the change in optimized capacity requirements in each zone in the project case vs. the base case based on the resource adequacy model analysis described above.
- We use a \$1,320 per kW (\$2020) base capital cost for a hypothetical DEFR technology and \$14 per kW-year fixed operating cost, based on estimates by Hernandez and Gençer (2021) for a hydrogen-fueled combustion turbine with selective catalytic reduction. We apply the same zonal cost ratios as in NYISO’s evaluation (1.00 for Rest of State, 1.14 for Hudson Valley, 1.39 for New York City and 1.30 for Long Island).

³² See “Outlook Policy Case Additions” for the S2 Case of NYISO’s 2021 System & Resource Outlook, available [here](#) in the Outlook Data Catalogue, and assumed generation investments costs in Appendix D of the 2021 Outlook, available [here](#)

- Based on the above assumptions, we quantify annual avoided costs of peaker capacity as the difference in optimized capacity requirement in each zone in the project case vs. the base case, multiplied by the levelized carrying cost of peaking capacity in the same zone.

C. Avoided Cost of Investment to Satisfy State Policy Mandates

NYISO's evaluation quantified the ability of the proposed PPTN projects to avoid or defer investments in renewable generating capacity needed to satisfy the state's electricity sector mandates. Specifically, the CLCPA requires 70 percent renewable energy by 2030 and 100 percent zero emissions by 2040. NYISO developed its Policy Case assuming that these mandates are met, using a capacity expansion model to determine the amount of investment in wind and solar capacity that would be needed by 2040. NYISO then assumed that the increase in deliverable offshore wind energy resulting from the proposed PPTN projects would reduce the amount of land-based wind and solar the state would need to procure in order to meet its clean energy targets. After re-running the capacity expansion model to include the impact of the proposed PPTN projects, NYISO found that approximately 1.3 GW of investment in solar PV capacity could be avoided by 2040.³³

This is a reasonable approach to estimate the environmental policy benefits of the proposed PPTN projects (e.g., their ability to reduce the cost of achieving environmental goals). However, NYISO's calculation can be improved in the following ways:

- *Impact of Avoided Investments on Production Costs:* NYISO's evaluation did not consider that renewable generation investments that are avoided by the proposed PPTN projects would no longer be available to provide production cost benefits. This results in double-counting of project benefits by assuming that the avoided solar projects continue to provide zero-cost energy even if they are never built.
- *Annualization of Avoided Costs:* NYISO calculated avoided cost savings by discounting the capital cost of each investment deferred or avoided in each year, rather than the annualized carrying charge of the investment. This misaligns the timing of when the savings are counted from the actual delivered benefit, which is the reduction of carrying costs over the lifetime of the avoided investment. Additionally, NYISO did not consider avoided O&M costs of renewable investments.
- *Avoided Local Transmission Investment:* NYISO used a zonal capacity expansion model to determine the amount of upstate renewable investment that could be avoided. However, NYISO's 2021 System & Resource Outlook study found that local transmission constraints will result in significant curtailment of renewables at many locations in upstate zones if they are not addressed. Hence, NYISO's analysis likely understates the avoided cost of renewable investments upstate, which may need to be accompanied by local transmission upgrades not considered in the capacity expansion model.

³³ See Figures 8 and 9 of Appendix N of NYISO's report.

- *Cost of Incremental Offshore Wind Energy:* NYISO’s Policy Case included 6 GW of offshore wind on Long Island and 12 GW statewide by 2040. This is significantly more than is required either by the PPTN (3 GW on Long Island) or by state policies (9 GW by 2035). It is also more than NYISO forecasted would be developed by 2040 as part of an efficient buildout of renewables to meet the 2040 zero emissions mandate in its System & Resource Outlook S2 Case, which only slightly exceeded the 9 GW mandate. NYISO’s evaluation did not account for the incremental net cost of deploying additional offshore wind to Long Island, which would offset avoided policy costs.

In our B-C Ratio, we estimated avoided policy costs using a methodology that is comparable to the one used by NYISO but accounts for the factors discussed above. We multiplied the net reduction of renewable curtailment provided by the proposed PPTN project in each year by Implied Net REC cost of procuring an equivalent amount of solar generation in that year. Our estimate of the avoided Implied Net REC cost of solar includes O&M costs and an estimate of the cost of local transmission upgrades per annual megawatt-hour of generation, based on the “Phase II” local transmission projects recently approved by the NYPSC.³⁴ In 2040 and beyond, we subtract out the Implied Net REC cost of additional offshore wind procurement needed to realize the project benefits from the avoided policy costs. This continues to yield positive savings because the INREC cost of offshore wind is projected to be below solar by that time.

D. Production Cost Modeling Assumptions

The NYISO estimated production cost benefits using the GE MAPS production cost model database developed as part of the 2021 System & Resource Outlook study (the “Outlook”). The NYISO relied on the “S2” case developed in the Outlook to model a resource mix that complies with New York state policy, specifically the requirement for an electric sector that is 70 percent renewable by 2030 and 100 percent zero-emissions by 2040, including 9 GW of offshore wind by 2035. In the “Policy” case for the PPTN evaluation, NYISO modified the Outlook S2 database to include 12 GW of offshore wind by 2040, with 6 GW located in Long Island.³⁵

While it is reasonable for the NYISO to rely primarily on the Outlook models, there are several modeling assumptions that could be modified to improve the accuracy of the estimated production cost savings.

1. Underestimation of Production Costs in GE MAPS

³⁴ See February 16, 2023 *Order Approving Phase 2 Areas of Concern Transmission Upgrades* in NYPSC Docket 20-E-0197. We estimate local transmission costs per megawatt-hour based on the levelized value of the estimated \$4.4 billion cost of the approved Phase 2 upgrades divided by the 30,332 GWh of energy deliverability headroom they are expected to provide.

³⁵ See Appendix L of NYISO’s report.

The current GE-MAPS model does not include transmission outages and unforeseen factors such as load forecast error that exacerbate congestion during actual market operations and, as such, does not fully capture the value of new transmission lines that may help mitigate the impact of such factors. Transmission outages drive a large share of congestion in market operations, especially in areas with renewable generation. In the AC Transmission Proceeding, the Brattle Group presented analysis showing that accounting for transmission outages and real world variability of system conditions would have increased estimated production cost savings by 40 percent.³⁶ We accounted for this issue in our B-C Ratio by incorporating the 40 percent adder. Considering these factors would significantly increase the estimated benefits of new transmission, we recommend that future production cost simulations explicitly consider them.^{37,38}

2. Impact of Long Island Reserve Requirements

NYISO's GE-MAPS analysis inaccurately estimates production cost savings and offshore wind curtailment benefits because it does not consider operating reserve requirements on Long Island. NYISO typically requires up to 1.3 GW of reserves on Long Island to maintain security and reliability following the two largest contingencies. Most of this is currently satisfied by older peaking capacity currently on Long Island with a portion of the reserves held on steam turbine units with long startup notification times. Given the sizes of offshore wind facilities in the interconnection queue, the reserve requirement for Long Island could rise up to 2.6 GW during periods of high wind production. Furthermore, the NYISO is evaluating the use of a reserve requirement to cover intermittent generation uncertainty based on the difference between the (POE50) wind generation forecast and the POE95 or POE99 forecast.³⁹ Holding reserves to cover this uncertainty will require the NYISO to commit thermal units on many days with high wind forecasts. This will lead to additional curtailment of offshore wind on Long Island because online thermal generation will reduce the amount of offshore wind that can be injected without curtailment. However, the baseline MAPS case does not model these reserve requirements.

In the long term, the impact of Long Island reserve requirements on offshore wind curtailments and production costs is highly uncertain. On one hand, large amounts of offshore wind may cause reserve requirements on Long Island to increase significantly in some time periods to secure against the loss or over-forecast of large wind resources. On the other hand, existing

³⁶ See slides 13-18 of the Brattle Group's October 8th 2015 presentation on *Benefit-Cost Analysis of Proposed New York AC Transmission Upgrades*.

³⁷ See Recommendation P19-6 in Section V.

³⁸ While the NYISO evaluated the reliability benefits from the proposed projects under various maintenance conditions as part of the Operability metric, this metric does not include a monetary valuation of the economic, environmental, and reliability impacts under maintenance conditions.

³⁹ The POE95 forecast refers to the MW level that has a 95 percent likelihood of being exceeded.

aging steam turbines may eventually be replaced by resources that can provide reserves without being committed to produce energy, such as battery storage or new dispatchable emissions-free technologies with fast startup times.

NYISO attempted to account for the impact of reserve requirements in the ‘P95 Case’ production cost model runs.⁴⁰ In this case, NYISO estimated the amount of transmission capability that would not be available for bulk imports and exports because it would be needed to account for ramping, regulation, and other unforeseen variations in net load (i.e., load minus wind and solar output) on Long Island. This was based on the 95th percentile (i.e., value which is exceeded 5 percent of the time) of changes in hourly net load on Long Island in each run year. This measure was intended to serve as a proxy for net load forecast *uncertainty*, which differs from net load *change* (because some of the hour-to-hour change in net load is predictable). NYISO deducted this value from the thermal limits of transmission lines between Long Island and neighboring areas, reducing the amount of capacity that can be imported or exported.

NYISO’s approach to quantifying the impact of Long Island reserve needs is quite simplistic and does not account for the dynamic factors described above. NYISO applied the same reduction of transmission capability in all hours of the year, instead of applying hourly values driven by factors that would affect reserve needs at different times (such as offshore wind output levels). This analysis assumes that reserves are held in the form of reduced utilization of the transmission interface, instead of being provided by local generators. As noted above, some generators can provide reserves while offline and avoid the need to restrict transmission capability. By not considering these factors, the CRM case provides only a very rough estimate of how ramping, regulation, and reserve needs will affect production cost benefits.

In our B-C Ratio we use NYISO’s CRM Case, since it is likely that a case with no adjustment for this issue will grossly understate benefits, especially as reserve requirements increase in the future. However, detailed modeling is needed to reliably estimate this benefit and the projected cost savings should be assumed to have an extremely high degree of uncertainty, especially in the outer years of the analysis when the dispatchable fleet is replaced by storage and unspecified new resource types.

3. Importance of Future Zero Emissions Fuel Cost Assumptions

NYISO’s evaluation assumed that there will be no remaining fossil generation in New York by 2040, consistent with the CLCPA’s zero emissions mandate. Hence, long term production cost savings are driven by the variable costs of dispatchable emissions free resources (DEFRs) that are assumed to replace the fossil fleet, as well as the cost of imports from other areas. NYISO assumed that the variable cost of DEFRs will be approximately \$150 per MWh (\$2022). As a

⁴⁰ See the subsection titled “Long Island Net-Load Variability Sensitivity” in Appendix L of NYISO’s report.

result, forecasted LBMPs increase rapidly during the study period. This is the main driver of the large increase in production cost savings attributed to the projects after 2035.

It is impossible to know what the fuel and variable operating costs of future zero-emissions dispatchable technologies will be. While it is generally expected that zero emissions fuels will be more costly than natural gas today, their precise costs will depend on many presently unknown factors. Hence, we recommend that NYISO examine multiple scenarios of DEFR cost assumptions in future PPTP evaluations. Ultimately, the DEFR cost assumptions result in an outsized importance of highly uncertain outer year production cost savings to the project's NPV. This suggests that it would be optimal to defer selection of a project until closer to the time when these large benefits are projected and more reliable information becomes available.

V. CONCLUSIONS AND RECOMMENDATIONS

The NYPSC issued an order stating the CLCPA constitutes a Public Policy Requirement, including the mandate to generate 70 percent of electricity from renewable sources by 2030 and the mandate to install 9 GW of offshore wind by 2035. The order identified a PPTN to support these mandates by increasing deliverability of offshore wind on Long Island to other areas of the State. In accordance with its tariff, NYISO evaluated 19 proposed projects that were proposed to address the PPTN. The NYISO published the Public Policy Transmission Planning report that summarizes the need, the proposed projects, V&S assessment, and the evaluation projects. NYISO has recommended the Board of Directors select Project T051.

We reviewed NYISO's report and evaluated the costs and benefits of the proposed projects in the context of assessing their effects on the NYISO markets. Based on this evaluation, we find that the proposed transmission projects are not estimated to be helpful for satisfying the 2030 mandate and they would make relatively modest contributions toward satisfying the 2035 mandate. Furthermore, the majority of the benefits of new transmission over the study period depend on the future costs and characteristics of DEFRs, which will likely be clarified in the coming years. In addition, investment in storage could be used to satisfy the 2030 and 2035 mandates more cost-effectively if it is not crowded-out by the new transmission. Given the estimated investment lead time of around six years and small benefits before 2040, it is premature to move forward with a capital-intensive transmission project at this time. These results support the following conclusions and recommendations:

- It is not advisable to move forward with one of the proposed transmission projects at this time given the magnitude and timing of the potential benefits. This process could be re-initiated in future years if warranted.
- If the NYISO determines that it must or should select a project, we recommend that it reconsider its recommendation of T051 since it does not appear to be the most cost-effective project.
- We recommend that the NYISO provide initial estimates of costs and benefits of generic potential transmission solutions to the PSC to inform future PPTN determinations.

In general, we found the NYISO's methodologies for this assessment are reasonable. However, we identify several methodological enhancements for NYISO to consider in future public policy transmission evaluations. Recommended enhancements are summarized below. Each recommendation is identified with a number indicating the year it was first published and the number it had in that document.

Recommendations for Future Modeling Enhancements

- P23-1: Evaluate capacity benefits of transmission using realistic local capacity requirements to estimate: (a) the avoided cost of generation investment that would otherwise be needed for reliability, plus (b) the economic value of improved resource adequacy.
- P23-2: Model DEFRs (dispatchable emission-free resources) with a range of costs and characteristics to understand how they will affect the future value of new transmission.
- P22-1: Model procurement of ancillary services in production cost models, considering how future needs will be driven by resource mix changes. Consider adoption of different production cost modeling software if needed to accomplish this.
- P22-2: Perform an ‘optimized’ production cost model sensitivity case in which renewable capacity in locations with high marginal rates of curtailment is relocated to locations with lower marginal rates of curtailment.
- P22-3: Improve modeling of energy storage to more accurately estimate the benefits of storage in the capacity expansion and production cost models.⁴¹
- P22-4: Include options for 2-, 6- and 8-hour storage in the Capacity Expansion Model.
- P19-6: Consider transmission outages and other unforeseen factors in estimating production cost savings.

Recommendations for Transmission Planners (including NYISO, utilities, and State agencies)

- P23-3: Provide additional information on costs and benefits of generic potential transmission solutions in comments to the PSC before its determination of the PPTN.
- P22-5: Estimate the Implied Net REC Cost of proposed regulated transmission projects and compare it to market-based alternatives including merchant battery storage and renewables. This will indicate if the transmission project is a cost-effective means to increase the supply of RECs to load compared to other investments.
- P22-6: Exercise caution when evaluating benefits of transmission projects whose value is strongly linked to uncertain long-term generator-siting decisions.
- P19-2: Estimate O&M costs of new and decommissioned facilities.

Recommendations for Policymakers

- P22-7: Price incremental clean energy from new and existing renewables in a uniform manner so that environmental goals can be satisfied in a more cost-effective manner.

⁴¹ Specifically, we recommend modifying (a) storage costs in the capacity expansion model to offset under-valuation of its benefits due to lower locational and temporal granularity, and (b) the siting and dispatch pattern of storage in MAPS to more realistically minimize renewable curtailment based on market incentives.

Appendix D: Frequently Asked Questions

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

Introduction

In response to the order issued by New York State Public Service Commission (“PSC”) on March 19, 2021, the NYISO anticipates soliciting Public Policy Transmission Projects and Other Public Policy Projects to address the Long Island Offshore Wind Export Public Policy Transmission Need (LI PPTN) for evaluation in the NYISO’s Public Policy Transmission Planning Process.

The NYISO held a Technical Conference with Developers and other interested parties on July 8, 2021. This frequently-asked-questions (FAQ) document summarizes questions that were received after or that were not fully addressed during the Technical Conference. The document is divided into two sections: (1) detailed questions on the assumptions and results of the Viability & Sufficiency Analysis (VSA) Baseline Analysis, and (2) general questions.

This document was revised on September 20, 2021 to correct a tariff citation in Q53.

VSA Baseline Analysis

Case Assumptions

Q1. What ratings are used in VSA Baseline cases?

NYISO Response:

Winter ratings are used in the spring light load cases and summer ratings are used in the summer peak load cases.

Q2. What are the assumptions for peaker units or aged units in Zone K (Long Island) and Zone J (New York City)? Can conventional units that are offline be switched on or redispatched?

NYISO Response:

The assumptions regarding the deactivation of generators subject to the DEC rules on air emissions from simple-cycle combustion turbines (6 NYCRR Part 227-3) are consistent with those reflected in the NYISO's latest FERC Form 715 Filings. In addition, the VSA Baseline cases also incorporate generator removal assumptions based upon age that are similar to the 2020 RNA 70 percent renewable energy by 2030 (70 x 30) scenario assumptions. Conventional units can be switched on or redispatched as long as their bus codes are not type 4 or Pmax = 0MW, indicating that a unit is unavailable.

Q3. Are there any must-run units in Zones J & K and can their output be reduced in the VSA?

NYISO Response:

Certain units in Zones J & K were modeled in-service to meet local reliability needs. Those units have "planttype" option marked as "UpOnly" in the subsystem file. These units should not be reduced from the dispatch level in the cases, but their output can be increased.

Q4. How is energy storage treated in the VSA? Can these units be dispatched in the economic 8,760 hourly simulations?

NYISO Response:

Energy storage units should not be dispatched in the VSA steady state analysis, but they may be dispatched in the evaluation and selection analyses, including production cost simulations.

Q5. Can status of the Zones I & J series reactors be changed in the Baseline cases?

NYISO Response:

Generally, the status of series reactors should not be changed in the Baseline cases. In the evaluation and selection phase, NYISO may consider changes proposed by the developer to the status of the series reactors.

Note, at the July 23, 2021 ESPWG/TPAS meeting, Con Edison presented an update to their Local Transmission Plan to place the line 41 & 42 (Gowanus-Farragut) series reactors in-service starting in 2025. The summer peak Baseline case models these reactors as bypassed, but their status will not materially affect the Baseline results. After consultation with the local TOs, the NYISO may make necessary topology updates in the Evaluation & Selection phase, but does not intend to update the VSA cases.

Q6. How are the offshore wind projects modeled in the case?

NYISO Response:

With the exception of Q#612/695 South Fork Wind, all of the proposed offshore wind generators are currently modeled simply as injections at their point of interconnection because their final configurations have not yet been determined. The NYISO may make modeling changes or add scenarios in the evaluation and sufficiency assessments if there are offshore wind project updates available.

Q7. Are any of the transmission projects in the Utility Investment Working Group report, a component of the PSC PowerGrid study, modeled in the cases?

NYISO Response:

Firm Transmission Owner Local Transmission Projects are modeled in the cases, including the three Con Edison TRACE projects in New York City and LIPA's 33kV Barrett double bus tie reconfiguration, Wildwood to Riverhead 69 kV to 138 kV conversion, and the new 138 kV Riverhead to Canal circuit.

Q8. Which year's load forecast is modeled in the Baseline and Alternate scenarios?

NYISO Response:

For summer peak load cases, the New York Control Area (NYCA) loads are consistent with the 2021 Gold Book¹ projection of the net 2031 Summer Coincident Peak load including the impact of the behind-the-meter (BTM) distributed generation assumptions. For the spring light load cases, NYCA loads are 45% of 2031 Summer Coincident Peak load including the BTM distributed generation assumptions.

Q9. In the Alternate Scenario, where does the East Garden City offshore wind interconnect?

NYISO Response:

In the Alternate Scenario, the offshore wind is connecting on the 345kV side of East Garden City, bus number 128825.

Q10. What is the schedule of controllable LIPA imports in VSA Baseline assumptions?

¹ <https://www.nyiso.com/documents/20142/2226333/2021-Gold-Book-Final-Public.pdf/b08606d7-db88-c04b-b260-ab35c300ed64?t=1619631804748>

NYISO Response:

In the VSA Baseline cases, line 901 (Valley Stream – Jamaica 138 kV) is scheduled at 100 MW from Long Island to New York City, and line 903 (Lake Success – Jamaica 138 kV) is scheduled at 200 MW from Long Island to New York City, for a total of 300 MW. The Neptune line is scheduled at 660 MW import in the summer peak case and 0 MW import in the spring light load case. The Cross Sound Cable and Northport-Norwalk PARs are scheduled at 0 MW import for the summer and spring light load cases. The Y49 line (Sprain Brook – East Garden City 345 kV) is scheduled such that the Zone K to I flow is evenly split between the Y49 and Y50 (Dunwoodie – Shore Rd 345 kV) lines.

Depending on a PPTN project's capability, a Developer may propose to change these schedules, and schedules of internal PARs, as long as the following are met:

- Maintain at least a total of 300 MW flow scheduled into Jamaica.*
- For any PAR within Long Island, on a Long Island tie line, or proposed as part of a PPTN project, the scheduled pre-contingency flow on the PAR should be no more than 75% of its rating, per the Transmission Expansion and Interconnection Manual.*
- Scheduled flows on external tie lines are maintained.*

Q11. A few 138kV circuits in Long Island system have winter ratings lower than summer ratings, are these correct?

NYISO Response:

The NYISO confirmed that these circuit ratings were correct at the time of the Baseline Assessment.

Simulation Software and Options

Q12. Which software did NYISO use for running the contingency analysis?

NYISO Response:

NYISO conducted the Baseline Assessment with TARA 1902.2.

Q13. Will NYISO provide TARA option files?

NYISO Response:

NYISO will provide N-1 and N-1-1 option files in CSV format in the latest base case package. The options files used in the baseline case and alternate scenario were created to help minimize the high number of overloads found with up to 12 GW of offshore wind connected to the existing transmission system. Developers may use different options in development of their project as long as they are consistent with the Sufficiency Criteria.

Q14. Why are “enforcePmax” and “unitSelectionMode” not enforced in the NYISO’s TARA options file?

NYISO Response:

The “enforcePmax” option is only effective for units with an initial Pgen of larger than Pmax. In the Baseline case and Alternate Scenario, generators are dispatched below Pmax, so “enforcePmax” will not affect results. The “unitSelectionMode” applies user-defined unit/load selection options. Developers may

Page 7 of 17 NYISO Long Island Offshore Wind Export PPTN FAQ – August 11, 2021, revised September 20, 2021.

enable or change these options based on their preferences. A few units in Long Island are dispatched in-service, but below P_{min} , in case of outage of an offshore wind plant in a load pocket, such as Barrett.

Monitor & Subsystem Files

Q15. Are offshore wind and other renewables included in the inertial response of the system, i.e. “default inertia” subsystem?

NYISO Response:

The default inertia subsystem is for the entire Eastern Interconnect system, including offshore wind and other renewables. Any post-contingency output change to the downstate renewables in the VSA would be minimal.

Q16. What is the study area for Baseline Assessment?

NYISO Response:

The VSA will consider the entire NYCA. To manage the large number of constraints, the Baseline Assessment focused on contingencies and monitoring in Zones H - K.

Q17. Can radial facilities be excluded from monitoring?

NYISO Response:

Radial facilities can be excluded for voltage monitoring for the post-contingency conditions.

Q18. Can flow on Dysinger PAR reverse?

NYISO Response:

In VSA, yes, as long as it will not result in any violations. The scheduled pre-contingency flow on a PAR should be no more than 75% of its rating, per the Transmission Expansion and Interconnection Manual.

Contingencies and Allowable System Adjustments

Q19. Are any offshore wind generation units allowed to curtail output under N-1-1 conditions for the Baseline or Alternate Scenarios?

NYISO Response:

Per the sufficiency criteria, offshore generation cannot be curtailed for the Baseline cases. There are no requirements for the Alternate Scenario; those results are provided for information. However, the Alternate Scenario, among other possible scenarios with higher offshore wind buildout, will be used to assess the benefits of proposed transmission projects in the evaluation and selection phase, including under N-1-1 conditions.

Q20. Are renewables other than Long Island offshore wind allowed to be redispatched in the VSA?

NYISO Response:

Renewables in Zones H - J should not be redispatched. This includes offshore wind, utility scale solar, and the Rainey HVDC. For purpose of the VSA, upstate renewables are allowed to be redispatched, if necessary.

Q21. Should contingencies for the loss of an entire offshore wind plant be respected?

NYISO Response:

Yes, per Q6, the configuration of these offshore wind farms are unknown and a single element contingency could result in loss of the entire plant.

Q22. Are Bus Section contingencies and P5 contingencies included in VSA Baseline analysis?

NYISO Response:

Bus Section and P5 contingencies are included in N1 and L2 contingency decks and will be simulated according to the appropriate criteria.

Q23. Will “SB:SPRA345_RN2” and “Y49 M29” contingencies be included in contingency deck?

NYISO Response:

Yes. These two contingencies have same impact as the loss of the Y49 cable for the Baseline cases, but could have different impacts depending on the potential PPTN project-related transmission topology changes.

Q24. Can developers ignore the automatic single branch outages command in the N1 & L2 contingency files?

NYISO Response:

Yes, as long as developers account for any new contingencies that could be created by the PPTN project or other case assumptions.

Contingency Analysis Criteria

Q25. Which set of ratings is utilized for cables in Con Edison under N-1 and N-1-1 conditions?

NYISO Response:

The NYISO utilizes LTE ratings unless the NYSRC Reliability Rule Exception for underground cables may be applied. For the VSA, the study auxiliary files have accounted for the appropriate ratings for securing the system.

Q26. What facilities need to be secured for Single + Multiple contingency combinations in N-1-1 analysis?

NYISO Response:

BPS elements should be secured for Single + Multiple contingencies.

Q27. Should the LIPA 138 kV BES or BPTF (and not BPS) facilities meet NERC TPL-001-4 performance requirements, or meet performance requirements specified in NPCC Directory 1?

NYISO Response:

LIPA 138kV and above facilities should meet all applicable NERC, NPCC, and NYSRC performance requirements. However, there are no LIPA 138 kV facilities classified as BPS and subject to NPCC and NYSRC performance criteria. Any new 345 kV facilities will be assumed to comply with NPCC and NYSRC BPS criteria in the VSA.

General

Sufficiency Criteria

Q28. Can non-wires or hybrid (e.g., transmission plus generation/storage) solutions be proposed and would they be eligible for recovery under the NYISO tariff?

NYISO Response:

All solutions can be proposed and considered in VSA. Note, for this particular PPTN, an intertie cable is required under the sufficiency criteria. Moreover, in order to be eligible for cost recovery under NYISO OATT, the solution must be transmission only.

Q29. Is the requirement for a new intertie to increase transfer capability between Zones K & I, between Zone K & J, or both?

NYISO Response:

The requirement is for a new transmission intertie cable between Zone K and the rest of the NYCA.

Q30. Would potential solutions that do not include a new Zone K intertie, but otherwise satisfy all of the PPTN requirements, be considered?

NYISO Response:

Transmission solutions that do not include a new intertie cable between Zone K and the rest of NYCA will not be deemed sufficient and will not move on to the second phase of the evaluation. The PPTN solution must resolve both relevant Zone K and interface constraints, as well as relevant constraints outside of Zone K (see next section).

Q31. Will the ISO consider potential solutions that utilize offshore transmission facilities?

NYISO Response:

The NYISO will consider all solutions, including those that utilize offshore transmission facilities.

Q32. What N-1-1 criteria will apply in VSA?

NYISO Response:

NERC, NPCC, NYSRC, and TO N-1-1 criteria will apply. Con Edison's N-1-1-0 criteria will not be performed during VSA, but will be applied in the interconnection studies.

Potential Constraints Excluded From Sufficiency Criteria

Q33. Are all constraints below 138 kV in Zone K excluded from the Developer's responsibility to resolve within their proposals?

NYISO Response:

Yes, constraints below 138 kV that are not BES do not need to be addressed under sufficiency criteria.

The interconnection process will identify upgrades for any lower voltage reliability violations caused by a PPTN project.

Q34. Do all observed overloads need to be relieved?

NYISO Response:

Constraints that are driven primarily by other VSA baseline assumptions (e.g., New York City-connected offshore wind plants and the Rainey HVDC), rather than Long Island offshore wind, do not need to be resolved by the project under the sufficiency criteria.

Q35. Can the NYISO clarify which constraints related to the interconnection of Long Island offshore wind farms do not need to be addressed under sufficiency criteria?

NYISO Response:

In addition to constraints discussed in Q33 and Q34, the Barrett – New Bridge Rd and Barrett – Valley Stream 138 kV² constraints do not need to be resolved. However, a PPTN project should not make these constraints worse.

Q36. NYISO has indicated that certain constraints/overloads are excluded from the sufficiency criteria. How will these constraints be treated in selection criteria?

NYISO Response:

In most cases, the excluded constraints will not be considered in the selection criteria unless they are a distinguishing factor between projects. For example, a project that results in no 69 kV overloads may be viewed more favorably compared to a project that results in many 69 kV overloads for the same level of offshore wind export.

Q37. Will the upgrades to facilities (specifically the 138kV lines near Barrett) resulting from previously awarded offshore projects be included in the evaluation and selection phase?

NYISO Response:

It is too preliminary to model these upgrades based on the presentation³ for the Empire Wind 2 developer at the August 2, 2021 TPAS/ESPWG meeting. If new information on these upgrades becomes available, NYISO may consider it after the VSA.

Additional Resources

Q38. Can NYISO share the equipment ratings indicating what is limiting for circuits identified as overloaded in the Baseline case results?

² The Technical Conference presentation mentioned Barrett to East Garden City 138 kV lines. This FAQ clarifies that it is the Barrett to New Bridge Rd. and Barrett to Valley Stream 138 kV constraints that are excluded from sufficiency criteria.

³ <https://www.nyiso.com/documents/20142/23466290/EW2%20PPTN%20Proposal%20r2.pdf/e62df6b4-0ec1-e542-9427-7cf8d973468f>

NYISO Response:

Rating sheets for the relevant LIPA and NYPA circuits will be provided to Developers with CEII approval.

Q39. Can NYISO provide system diagrams for Zones J & K systems?

NYISO Response:

One line system diagrams will be provided to Developers with CEII approval.

Q40. Does NYISO provide stability, short circuit, and economic planning databases used in the analyses?

NYISO Response:

Only power flow cases were created for the VSA. Developers may request the standard NYISO stability and short circuit databases in a CEII/NDA request form, but these will not be included in the VSA assumptions. The NYISO's economic analysis databases are not provided because they contain Confidential Information that the NYISO cannot disclose under its Code of Conduct. See OATT Attachment F.

Evaluation Assumptions

Q41. How will the evaluation treat transmission projects in NYSERDA's Tier 4 solicitation?

NYISO Response:

A generic 1,310 MW HVDC injection at Rainey is modeled for the VSA. NYISO may update the analysis databases with up-to-date information in the evaluation and selection phase, including any projects that are awarded Tier 4 Renewable Energy Credits (RECs) and known associated upgrades.

Q42. How did NYISO determine the points of interconnection (POI) for the non-awarded offshore wind farms modeled in the Alternate Scenario (6 GW of offshore wind in Zone J and 6 GW of offshore wind in Zone K)?

NYISO Response:

NYISO consulted with stakeholders and policymakers, and reviewed development trends in choosing the offshore wind assumptions. These specific offshore wind points of interconnection (POIs) and sizes are reasonable assumptions of a possible offshore wind buildout and do not indicate any specific knowledge of development plans. Other scenarios, including different offshore wind POIs and sizes, may also be used in the evaluation and selection phase.

Q43. What are the interconnection statuses of the offshore wind projects with NYSERDA or LIPA awards and are their study reports available?

NYISO Response:

On the NYISO interconnections site, <https://www.nyiso.com/interconnections>, you may view any completed study reports and the interconnection status on the NYISO Interconnection Queue.

Evaluation Metrics

Q44. Will feasibility and high-level constructability be considered when evaluating cable routes?

NYISO Response:

Yes, the NYISO will consider these factors in the evaluation and selection phase in selection criteria, such as risk to project completion.

Q45. Will NYISO focus on Long Island when considering impacts on system utilization (i.e., performance)?

NYISO Response:

NYISO will consider the project's impact across the entire NYCA system.

Q46. Could NYISO provide clarity on the “Transfer Capability” and “Cost per MW”, and will it consider Zone K import or export limits?

NYISO Response:

Given the range of load and generation conditions, these metrics will assess the project's ability to export offshore wind across the relevant interfaces. “Cost per MW” will be calculated using the cost of the entire project. A project's ability to import power into Long Island during low wind periods will also be assessed in these or other metrics.

Q47. Will NYISO apply a social cost of carbon pricing in the Evaluation/Selection phase?

NYISO Response:

The NYISO may consider the social cost of carbon or other carbon price indices, but it has not been determined if and how social cost of carbon will be considered in the LI PPTN. You may review the how social cost of carbon was evaluated in the AC Transmission PPTN in section A5.1 (Social Cost of Carbon Sensitivity) of the AC Transmission Public Policy Transmission Planning Report Addendum.

Developers may also wish to consult the New York State Department of Environmental Conservation Guidelines for “Establishing a Value of Carbon” See

https://www.dec.ny.gov/docs/administration_pdf/vocguidrev.pdf

Q48. Could NYISO provide clarity on the operability metric?

NYISO Response:

See the NYISO's presentation at the Technical Conference on the operability metric on slide 50. Developers may wish to review the WNY and AC Transmission reports as an example of past evaluation of the operability metric.

Q49. Should land acquisition costs be included in the cost estimate of each solution? How will property costs be considered for solutions that include demonstrated site control?

NYISO Response:

Yes, land acquisition costs should be included in the cost estimate of each solution for the evaluation phase cost metric. While the property acquisition costs are excluded from cost containment, they will be evaluated in the overall cost of the project. NYISO's independent consultant will also determine a cost for a solution's land acquisition. Solutions with site control will have their real property value cost evaluated by NYISO's independent consultant for use in the project evaluation.

Public Policy Process

Q50. What communication points will the Developer have with the NYISO prior to and after solution submission?

NYISO Response:

Prior to submission, communication will be primarily through ESPWG/TPAS stakeholder meetings. Any written questions NYISO can answer will be addressed at a stakeholder meeting or additional FAQ documents. Questions may be submitted at any time to PublicPolicyPlanningMailbox@nyiso.com. After project submission, NYISO may request project clarification or additional information from the developer at any point in the process. See OATT §31.4.4.3.5. NYISO may also invite each Developer to give an introductory presentation to NYISO during VSA. Direct communication between NYISO, the Developer, and TOs will likely be more frequent in the interconnection process than in the public policy project evaluation.

Q51. How will solution proposals be submitted?

NYISO Response:

Developers should complete all required information 31.4.5.1 of Attachment Y by completing and submitting to the NYISO the forms set forth in Attachments B and C to the PPTPP manual.⁴ Note that Attachment C was recently updated and posted on August 6, 2021. The application materials should be emailed to PublicPolicyPlanningMailbox@nyiso.com and NYISO will provide instruction if any attachments are too large to be sent via email. An interconnection application is also required for each project through the interconnection project community (additional information can be found at <https://www.nyiso.com/interconnections>).

Q52. Is there a required or expected in-service date of a PPTN solution?

NYISO Response:

There is no required in-service date. NYISO will review the developer's proposed project schedule and take it, and any associated in-service risks, into consideration during the evaluation and selection phase. The NYISO will consider the extent which a project can timely enter into service to meet the requirements of the Climate Leadership and Community Protection Act.

⁴ <https://www.nyiso.com/manuals-tech-bulletins-user-guides>

Page 15 of 17 NYISO Long Island Offshore Wind Export PPTN FAQ – August 11, 2021, revised September 20, 2021.

Q53. How will NYISO consider PPTN facilities jointly developed with a non-PPTN developer not seeking cost-recovery through the Public Policy Transmission Planning Process?

NYISO Response:

NYISO will consider whether other projects are sufficiently firm to be included in its modeling for project evaluation. OATT 31.4.5.1.4 and 31.4.5.1.6 details the submission requirements for contracts and financing for PPTN solution facilities.

Upgrades

Q54. Is an Upgrade still treated as an upgrade if the project is proposed by the incumbent TO?

NYISO Response:

The definition of “upgrade” under Section 31.6.4 of Attachment Y does not change based on the entity that proposes the facility. However, in anticipation of the NYISO filing pending tariff revisions that were discussed with stakeholders at various working groups from June 2021 to August 2021, if a Transmission Owner proposes modifications to its own facilities as a component of their Public Policy Transmission Project and those modifications meet the definition of a Public Policy Transmission Upgrade (to be defined in Section 31.1 of Attachment Y), the NYISO will designate those Public Policy Transmission Upgrades in accordance with the proposed designation process. Public Policy Transmission Upgrades will be designated to the Transmission Owner that owns the facility.

Q55. Are developers required to provide a cost for facilities it classifies as upgrades?

NYISO Response:

Yes, a Developer is required to submit cost estimates for all project components including new facilities and upgrades. Any voluntary cost cap should also include all project components. However, in anticipation of the NYISO filing pending tariff revisions that were discussed with stakeholders at various working groups from June 2021 to August 2021, the NYISO advises Developers to provide separate cost estimate figures for project components are new facilities and upgrades. In addition, a Developer that wishes to propose cost containment should continue to include capital costs consistent with the tariff that is effective at the time of submission. A Developer may also submit a proposed cost cap that only include facilities that the Developer considers to be new transmission facilities. Once the aforementioned tariff provisions are effective, NYISO will afford Developers an opportunity to clarify any submitted cost containment mechanisms to align it with what constitutes Included Capital Costs and Excluded Capital Costs.

Production Cost Simulation

Note, the economic planning database that will be used in the Evaluation & Selection phase is currently under development. Therefore, the majority of the answers provided in this section refer to the most recent database from the 2019 CARIS study⁵. These answers represent past NYISO practice, but may not reflect the future study practice, including for evaluation of projects in response to the LI PPTN. A data

⁵ <https://www.nyiso.com/documents/20142/2226108/2019-CARIS-Phase1-Report-Final.pdf>

Page 16 of 17 **NYISO Long Island Offshore Wind Export PPTN FAQ – August 11, 2021, revised September 20, 2021.**

catalog has been added to the end of this document containing links to the 2019 CARIS input data and results. The Economic Planning Manual is currently being revised with stakeholder review and contains additional information on the assumptions and methodology typically used in NYISO production cost simulations.

Q56. What network model will the production cost simulations use?

NYISO Response:

The LI PPTN database will utilize the models from the 2021-2040 System & Resource Outlook, which is currently under development, and may take into consideration the latest system updates. The NYISO will build out a 30-year baseline database and a 20-year database for each PPTN project starting with the project in-service date. A comparison of the results of project and baseline cases will be performed to determine the project benefits.

Q57. What are the monitored facilities, facility ratings, and contingencies used in the production cost simulations?

NYISO Response:

See Section 3 Methodology and Metrics, and Section 4 Model Assumptions of the 2019 CARIS report, as well as more details in Appendix C and Appendix D.

Q58. How will NYISO model the existing PARs on the LIPA interface for the purpose of production cost modeling?

NYISO Response:

In the 2019 CARIS, existing PARs on the LIPA interface had their hourly schedules optimized based on minimizing production cost.

Q59. How is the generic 1,310 MW HVDC injection at Rainey 345 kV modeled in the production cost simulations?

NYISO Response:

In the 2019 CARIS, the generic HVDC injection at Rainey 345 kV was modeled as a fixed pattern injection with no northern terminal, and it was given an historic HQ-NYISO schedule scaled to provide a maximum output of 1,310 MW. The LI PPTN, evaluation and selection phase may use updated modeling assumptions based on any updates in the 2021-2040 System & Resource Outlook as well as any NYISERDA Tier 4 REC award(s).

Q60. How will NYISO model the 138 kV Barrett constraints that are excluded from sufficiency criteria in production cost modeling?

NYISO Response:

In the LI PPTN, securing these lines will depend on if there are any relevant system updates, including upgrades associated with the Empire Wind II projects. Absent any such updates, NYISO does not intend

to secure these lines.

Q61. What generation dispatch profile will NYISO use for offshore wind projects?

NYISO Response:

In the 2019 CARIS, hourly offshore wind profiles were based off the NREL database and adjusted for offshore wind farm size and location.

Property Rights

Q62. Please describe the process or processes for obtaining rights to use existing utility right-of-ways?

NYISO Response:

Developers should indicate how they intend to obtain property rights for their project, including, but not limited to use of new or existing rights of ways. Review OATT sections 31.4.5.1.1, 31.4.5.1.4, and 31.4.8.1.7 for more detail.

Q63. There is an exception within the Article VII regulations that exclude underground transmission lines in a city with a population in excess of 125,000. Is there a requirement to file an Article VII or can you utilize the exception if applicable?

NYISO Response:

Questions regarding Article VII siting requirements should be directed to the New York State Public Service Commission.

Introduction

On August 12, 2021, the NYISO solicited Public Policy Transmission Projects and Other Public Policy Projects to address the Long Island Offshore Wind Export Public Policy Transmission Need (LI PPTN) for evaluation in the NYISO's Public Policy Transmission Planning Process.

The NYISO held a Technical Conference with Developers and other interested parties on July 8, 2021, and issued a frequently-asked-questions (FAQ) document on August 11, 2021, that summarizes questions that were received after the Technical Conference. This document is a supplemental FAQ to address questions received since posting of the August 11 FAQ. Please refer to the following references which provide more detail on the topics related to these questions:

August 11, 2021, FAQ

<https://www.nyiso.com/documents/20142/22968753/LIPPTN-FAQ-08112021.pdf/9ea835b4-4343-be80-cdc2-c932a067e5cd>

LI PPTN Project Solicitation

Technical Conference Presentation:

<https://www.nyiso.com/documents/20142/22968753/LI-PPTN-TechConference.pdf/c9ab8cbb-9104-b145-3b43-d5b0de929114>

Case Assumptions

Q1. Will the renewable buildout assumptions in the Evaluation and Selection cases be the same as in the Viability & Sufficiency Analysis (VSA) cases?

NYISO Response:

For land-based renewable resources, the VSA cases used assumptions similar to the 2020 RNA “70 x 30” scenario, which were also similar to the assumptions used in the 2019 CARIS “70 x 30” scenario. In the Evaluation & Selection phase, the land-based renewable resource buildout assumptions will be updated mainly based on the assumptions being developed for various scenarios in the 2021-2040 System & Resource Outlook and updated if necessary. The offshore wind assumptions will be consistent with the VSA Baseline and Alternate Scenarios, but other offshore wind scenarios may be considered as well.

Q2. Can the schedule of the external tie lines with PJM and ISO-NE be adjusted in the base case or after a first level contingency? Similarly, can the schedules of the 901 and 903 Jamaica 138 kV tie lines with Con Edison be adjusted?

NYISO Response:

In the VSA, the schedules of the external ties lines will not be adjusted, even after first level contingency. The scheduled flows on the 901 and 903 lines can be adjusted in the base case or after the first level contingency, provided the schedule is not greater than 75% of the facility rating and at least 300 MW is scheduled into Jamaica (see Q10 of August 11, 2021, FAQ). However, NYISO will evaluate if any change on the 901 and 903 schedules in combination with the project results in additional reliability or operability concerns during the VSA and the evaluation and selection phases.

Contingency Analysis Criteria

Q3. Did NYISO use TARA’s Security Constrained Dispatch (SCD) in the Baseline Analysis?

NYISO Response:

Yes, the NYISO enabled certain SCD automated system adjustments when performing the analysis at N-0 and N-1 contingency levels. The options files have been provided to developers along with the baseline cases. Given the severity of constraints that SCD algorithms attempted to mitigate, the results could change with different SCD options. Developers may modify the SCD options to best optimize the results for their post-project cases. However, the SCD options must be consistent with the LI PPTN sufficiency criteria. See the August 11, 2021, FAQ for more details on allowable system adjustments.

Q4. Which contingencies should be included in the N-1-1 analysis?

NYISO Response:

VSA will consider NERC TPL and LIPA N-1-1 criteria for the Bulk Electric System (BES) facilities and NPCC and NYSRC N-1-1 criteria for the Bulk Power System (BPS) facilities. Please refer to the file

“TS2021_Yr_2031S_L1_PPTN_v0.con” for first level contingencies and “TS2021_Yr_2031S_L2_PPTN_v0.con” for second level contingencies.

Note, the provided contingency files contain contingencies, e.g., multiple element contingencies, for the second level which are applicable to BPS facilities, but not applicable for non-BPS facilities (including LIPA’s 138 kV system). For the purpose of meeting the sufficiency criteria, a developer may ignore any N-1-1 constraints that are beyond criteria. Developers may modify the auxiliary files the NYISO provided, specifically the N-1-1 exclude file, to change which facilities are monitored for different contingency types – provided that the analysis respects all applicable criteria.

Developers are reminded to account for contingency modifications related to system changes associated with their LI PPTN projects.

Q5. Should lines be secured to LTE ratings (Rate B) for N-1-1 analysis?

NYISO Response:

Yes, most elements should be secured to the LTE rating with notable exceptions contained in the exclude file. Con Edison’s N-1-1-0 criterion requires that certain facility loadings return to normal rating (Rate A), but this analysis will not be required as part of the VSA.

Q6. How will Con Edison’s N-1-1-0 criteria be used in the evaluation?

NYISO Response:

Con Edison’s N-1-1-0 planning criteria will not be considered under the sufficiency criteria in the VSA. N-1-1-0, along with all other applicable reliability criteria, will be evaluated in the interconnection process and considered in the evaluation and selection phase. To the extent possible, any Network Upgrade Facilities and cost estimates identified in the interconnection process will be incorporated in the evaluation and selection phase.

Q7. Is non-consequential load loss (i.e., load shedding that is not a direct consequence of a contingency event) allowed in the VSA?

NYISO Response:

No, load shedding will not be permissible to resolve any violations in VSA.

Q8. Can Barrett 138 kV contingencies be excluded given the anticipated Empire 2 Wind’s upgrades?

NYISO Response:

Certain identified overloads near Barrett 138 kV are expected to be resolved by the Empire Wind 2 upgrades. However, there is no indication that these future upgrades will affect the Barrett 138 kV contingency definitions. Therefore, these contingencies will be included in the VSA.

Q9. NYISO indicated that minimal output changes to renewables is possible based on inclusion in the “Default Inertia” subsystem. Does this mean that curtailment of Zone K solar is allowed in the VSA?

NYISO Response:

Curtailment of Zone J & K renewable resources, both solar and wind, is not allowed in the VSA. The “Default Inertia” subsystem allows power balancing following a loss of generation contingency to be spread across the entire Eastern Interconnection. The resulting minimal post-contingency generation changes are consistent with NYISO planning processes, but pre-contingency reduction of Zone J & K renewable resources is not allowed under the sufficiency criteria.

Q10. Is there any limit to the allowable amount of offshore wind curtailment allowed in the Alternate scenario?

NYISO Response:

No. Although curtailment is not allowed in the Baseline scenario with 3 GW of Zone K offshore wind, there is no such requirement for the Alternate scenario with 6 GW of Zone K offshore wind. The Alternate scenario, among other potential scenarios, will be used to evaluate and compare the PPTN projects’ ability for the system to export more than the minimum of 3 GW. All else being equal, a PPTN project that results in less curtailment in the Alternate scenario will perform better in the expandability and other metrics. Such project performance will be considered in the comprehensive evaluation of all categories of metrics to select the more efficient or cost-effective solution.

Sufficiency Criteria

Q11. Can a PPTN solution include an offshore transmission system which would connect to the offshore wind generator collector systems and divert some of the output from offshore wind farms from their respective points of interconnection (POIs)?

NYISO Response:

The NYISO would consider such a project provided that it meets all the sufficiency criteria, including at least one new intertie cable connecting Zone K and the rest of the NYCA. However, Developers should be aware that offshore wind generation feeders are typically considered Generator owner attachment facilities and are subject to FERC’s precedent on open access and priority rights interconnection customers’ interconnection facilities. Developers proposing to interconnect to a Generator owner’s attachment facility should consider also submitting any agreements, if applicable, for the use of the attachment facility pursuant to Section 31.4.5.1.4 of Attachment Y.

Q12. Are 138/69 kV and 138/34.5 kV transformers part of the sufficiency criteria?

NYISO Response:

None of the LIPA 138/69kV and 138/34.5kV transformers are classified as BES and therefore those transformers are excluded from the sufficiency criteria.

Q13. Do the Valley Stream to East Garden City 138 kV constraints need to be addressed in the VSA given the anticipated Empire Wind 2 upgrades?

NYISO Response:

Many of the overloads identified in the Baseline Assessment are driven entirely by the Empire Wind 2 farm pushing power from Valley Stream to East Garden City and are expected to be resolved by the Empire Wind 2 upgrades. These overloads that are specific to Empire Wind 2 can be excluded from the sufficiency criteria, similar to the treatment of the Barrett – Valley Stream and Barrett – New Bridge Rd 138 kV overloads identified in the Baseline Assessment.

However, the East Garden City – Valley Stream 138 kV lines are a part of the overall export path of offshore wind power from Long Island to the rest of the New York Control Area. There could be constraints on these lines that are not driven solely by Empire Wind 2. Developers are advised to not simply ignore all overloads on the East Garden City – Valley Stream 138 kV lines as there could be constraints identified in the VSA or in other scenarios in the evaluation and selection phase that are relevant to addressing the LI PPTN.

General Questions

Q14. Can NYISO provide the details to P5 (fault plus relay failure) contingencies?

NYISO Response:

LIPA, the facility owner, will provide a general description of the relay schemes to be shared with developers.

Q15. Can NYISO provide breaker-level diagrams of Zones I-K?

NYISO Response:

NYISO has provided NYISO's system one-line and breaker diagrams. For more detailed system information, you may request this directly from the respective TOs.

Q16. What level of detail is required from the PPTN Developer for the cost estimates of the upgrades to existing transmission facilities?

NYISO Response:

Developers are required to provide adequate detail for all facilities that are a part of their project, including upgrades to existing facilities, for NYISO to do a thorough evaluation of all metrics in the evaluation and selection. The data submission attachments outlined in Attachment C of the Public Policy Transmission Planning Manual, including cost estimate attachments C.4.1-C.4.4, are required for both new facilities and upgrades to existing facilities.

Note that the NYISO recently proposed tariff changes to provide a mechanism to implement the TO's right-of-first-refusal over upgrades to their existing transmission facilities. If those tariff changes are accepted by FERC, the NYISO would rely on its independent consultant's cost estimates for those facilities during the evaluation and selection phase.

Introduction

On August 12, 2021, the NYISO solicited Public Policy Transmission Projects and Other Public Policy Projects to address the Long Island Offshore Wind Export Public Policy Transmission Need (LI PPTN) for evaluation in the NYISO's Public Policy Transmission Planning Process.

The NYISO held a Technical Conference with Developers and other interested parties on July 8, 2021, and issued a frequently-asked-questions (FAQ) document on August 11, 2021 and a Supplemental FAQ on September 1, 2021, that summarizes questions that were received after the Technical Conference. This document is a second supplemental FAQ to address questions received since posting of the September 1 Supplemental FAQ. Please refer to the following references which provide more detail on the topics related to these questions:

September 1, 2021, Supplemental FAQ

<https://www.nyiso.com/documents/20142/22968753/LIPPTN-SupplementalFAQ-0912021.pdf/c7d00a5e-d93e-453a-bd87-6569beaaf526>

August 11, 2021, FAQ

LI PPTN Project Solicitation

<https://www.nyiso.com/documents/20142/22968753/Long-Island-Offshore-Wind-Export-Public-Policy-Transmission-Need-Project-Solicitation.pdf/51b8fdeb-1a66-2938-f116-38f1be486e0d>

Technical Conference Presentation:

<https://www.nyiso.com/documents/20142/22968753/LI-PPTN-TechConference.pdf/c9ab8cbb-9104-b145-3b43-d5b0de929114>

Page 1 of 5 **NYISO Long Island Offshore Wind Export PPTN Supplemental FAQ – September 20, 2021**

Q1. Can NYISO provide substation diagrams?

NYISO Response:

The Long Island Power Authority (LIPA) and Consolidated Edison Company of New York, Inc. (Con Edison) have agreed to provide in-person access at their sites by NYISO Qualified Developers for viewing certain breaker-level diagrams of selected substations for the purpose of developing a LI PPTN solution, pursuant to a non-disclosure agreement (NDA) provided by each company for access to critical energy infrastructure information (CEII).

All requests for access must be in writing and provided two business days in advance. All visitors to Con Edison must comply with Con Edison's COVID requirements including wearing a mask while inside of Con Edison's building. All visitors to Long Island offices shall comply with PSEG Long Island Job Hazard Analysis (JHA) COVID related protocols. A copy of JHA can be provided. Please note that COVID related requirements are subject to change.

See the September 10, 2021, email to Qualified Developers for LIPA and Con Edison contacts to obtain more information.

Q2. Can NYISO provide the details to P5 (fault plus relay failure) contingencies?

NYISO Response:

The relay details associated with relevant P5 contingencies have been provided to developers.

Q3. What redacted information is required in the PPTN application?

NYISO Response:

Please refer to OATT Section 31.4.4.3.3, which states: "If the Developer submits Confidential Information, as defined in Section 31.4.15, as part of its project information submitted pursuant to Section 31.4.4.3.2 or as part of its additional project information submitted pursuant to Section 31.4.4.3.5, the Developer shall submit redacted and un-redacted versions of this project information pursuant to Section 31.4.15.4."

Q4. Please confirm the OATT sections referenced in the answer to Q53 in the August 11 FAQ.

NYISO Response:

The answer to Q53 incorrectly cites OATT 31.4.5.6.1, which should instead be OATT 31.4.5.1.6. The August 11 FAQ has been corrected and reposted on the NYISO website.

Q5. Is the PPTN project responsible to fix Zone J violations?

NYISO Response:

See Q34 in the August 11, 2021, FAQ. Constraints that are driven primarily by other VSA baseline assumptions (e.g., New York City-connected offshore wind plants and the Rainey HVDC), rather than Long Island offshore wind, do not need to be resolved by the project under the Sufficiency Criteria.

Page 2 of 5 **NYISO Long Island Offshore Wind Export PPTN Supplemental FAQ – September 20, 2021**

Q6. Are the LIPA bus section contingencies considered “multiple element” contingencies? Are these and other multiple element contingencies valid for the second level contingency for 138kV facilities?

NYISO Response:

Bus section contingencies are considered “multiple element” contingencies. Under the Sufficiency Criteria, “multiple element” contingencies are not valid as second level contingencies for facilities below 200 kV but are valid second level contingencies for facilities above 200 kV. See Q26 in the August 11, 2021, FAQ and Q4 in the September 1, 2021, Supplemental FAQ.

Q7. Can NYISO clarify what the facilities are in the “BMS Only” subsystem and if this is equivalent to the BES-only (non-BPS) system.

NYISO Response:

“BMS Only” facilities are secured by the NYISO for N-1 and N-1-1 conditions and are controlled by the TO. The “BMS Only” subsystem overlaps with BES-only (non-BPS) facilities, but they are not equivalent.

Q8. The NYISO indicated that it utilized TARA’s Security Constrained Dispatch (SCD) function to secure the system. Instead of using SCD, can developers demonstrate that facilities can be secured for each contingency individually?

NYISO Response:

SCD is a tool in TARA to automatically make system adjustments to mitigate violations. TARA’s SCD, other tools, or manual adjustment can be used to make system adjustments to secure the system. However, those system adjustments must be consistent with the Sufficiency Criteria and should be applied pre-contingency, or after first level contingency for N-1-1 analysis.

Q9. Please clarify if the “SOFT EXCLUDE MONTYPE 'LI_69” command in the exclude file applies to all contingencies?

NYISO Response:

Yes, the SOFT EXCLUDE command applies to all N-1 and N-1-1 contingencies. Securing the 69 kV system is beyond the Sufficiency Criteria and the above command would prevent facilities below 100 kV from being taken into consideration as part of SCD system adjustments, but these facilities will be monitored for information.

Developers may modify the provided auxiliary files, as appropriate, provided they are consistent with the Sufficiency Criteria. But this does not relieve the need to review all results to determine if specific constraints are included in the Sufficiency Criteria.

Q10. Can transformer taps and switched shunts be utilized post-contingency to bring voltages back within allowable limits? If so, can Developers indicate how the voltage violations were mitigated in the application?

NYISO Response:

NYISO standard planning practice is to allow automatic transformer tap and switched shunt adjustments pre-contingency, or after first level contingency in N-1-1, but not post-contingency. Certain post-contingency manual adjustments that model operator actions might be allowed under some system conditions. However, these operator actions will be reviewed during the interconnection studies.

If certain system adjustments are proposed for a project to meet the Sufficiency Criteria, a Developer may indicate such adjustments in their application or in response to NYISO follow up questions.

Appendix E: Proposed Solutions

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

Appendix E: Proposed Solutions

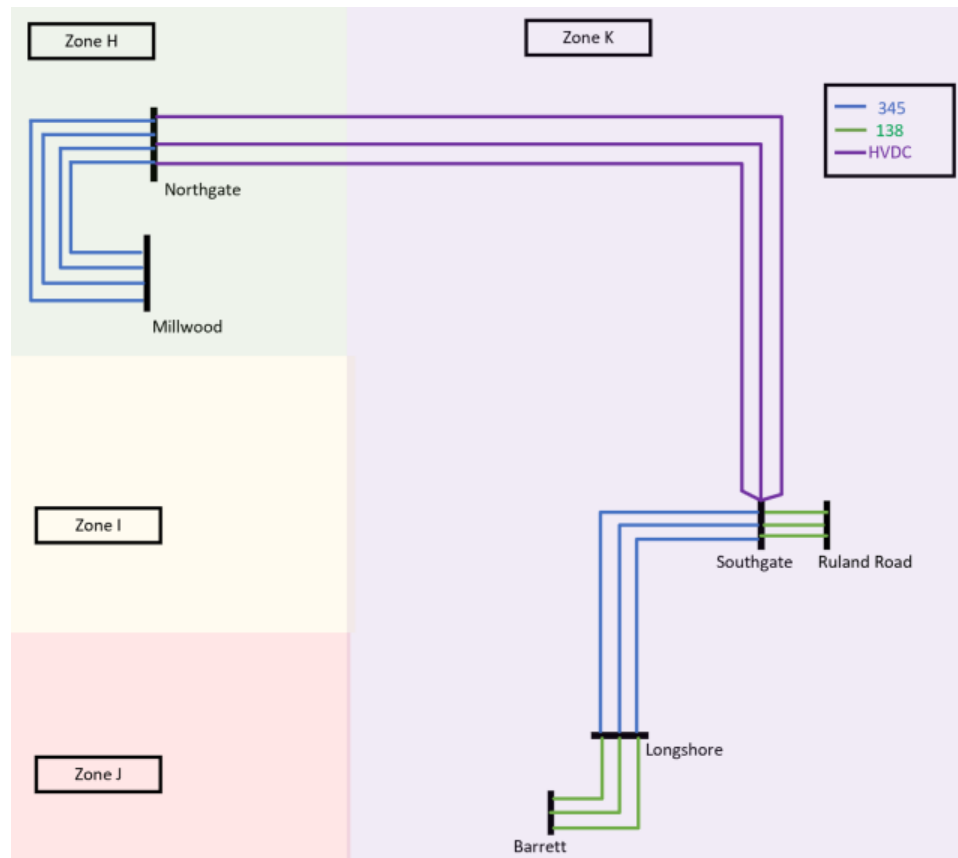

T035 LS Power Atlantic Gateway

LS Power Atlantic Gateway project proposal consists of the following components:

- Build a proposed Longshore 345/138 kV GIS substation interconnecting to the Barrett 138 kV substation with three phase angle regulators (PARs) on the proposed 345/138 kV transformers and two 150 MVAR shunt reactors
- Build a proposed Southgate 345/138 kV GIS substation interconnecting to Ruland Rd 138 kV substation with three ± 400 kV monopole DC converter stations each rated at 1200 MW and three 150 MVAR shunt reactors
- Build a proposed Northgate 345 kV GIS substation intercepting W80/W81/W97/W98 lines with three ± 400 kV monopole DC converter stations each rated at 1200 MW
- Build three proposed underground Longshore – Southgate 345 kV AC lines
- Build three proposed underground/submarine Southgate – Northgate ± 400 kV bi-directional DC transmission lines rated at 1200 MW each
- Reconductor East Garden City – Carle Place (138-361) and East Garden City – Roslyn (138-362)
- Replace terminal equipment on Holbrook – Ronkonkoma (138-875), Ronkonkoma – Central Islip (138-883), Holbrook – West Bus (138-888), and West Bus – Kings – Pilgrim (138-881)
- Reconductor a segment of and replace terminal equipment on Pilgrim PAR – Hauppauge (138-871)
- Replace terminal equipment Central Islip – Hauppauge (138-889)
- Glenwood South – Shore Road (138-365) upgrades (anticipated to be replacement of buswork and connections) to achieve a higher rating
- Reconductor of the 138 kV East Garden City – Carle Place line
- Reconductor the East Garden City – Roslyn 138 kV line
- Terminal upgrades at the Holbrook, Ronkonkoma, Central Islip, West Bus, Kings, Pilgrim, Glenwood South, and Shore Road (i.e., replacement of CTs or buswork) 138 kV substations
- Partial reconductor of the Pilgrim – Hauppauge 138 kV line with installation of a PAR

- Modify relay systems to eliminate P5 contingencies at the Barrett and Valley Stream substations

Figure 1: T035 LS Power Atlantic Gateway Major Project Components (Refer to the description above for complete list of project components)

T036 NextEra Core 1

NextEra Core 1 proposal consists of the following components:

- Build a proposed East Garden City 345 kV GIS substation with two 1050 MVA PARs regulating flow on the existing East Garden City – Sprain Brook and the existing East Garden City – Dunwoodie 345 kV lines
- Build a proposed Ruland Road 345/138 kV GIS substation with two 345/138 kV transformers
- Build a proposed Valley Stream 345 kV GIS substation with three 345/138 kV transformers
- Build a proposed Barrett 138 kV GIS substation with one PAR regulating flow on proposed East Garden City – Jamaica 138 kV transmission line
- Build a proposed Rainey 345 kV GIS substation
- Build a proposed Dunwoodie 345 kV GIS substation
- Modify the existing Newbridge Road 345 kV substation to add two breaker-and-a-half GIS bays
- Build a proposed East Garden City – Dunwoodie 345 kV transmission line
- Build a proposed East Garden City – Sprain Brook 345 kV transmission line
- Build a proposed Ruland Road – Sprain Brook 345 kV transmission line
- Build a proposed PAR-controlled East Garden City – Jamaica 138 kV transmission line
- Build three proposed East Garden City – proposed Valley Stream 345 kV transmission lines
- Partially reconductor the Newbridge Road – Ruland Road 138 kV line 561, 562, and 567
- Partially reconductor the Central Islip – Hauppauge 138 kV transmission line
- Rebuild the existing East Garden City – Newbridge Road 138 kV line 462 and 463 as two 345 kV transmission lines from the proposed East Garden City substation to proposed Newbridge Road substation
- Partially rebuild the Syosset – Oakwood 138 kV transmission line
- Partially rebuild the Syosset – Greenlawn 138 kV transmission line
- Loop the Newbridge Road – Bagatelle 138 kV line 563 into the proposed Ruland Road 138 kV substation
- Modify the East Garden City – Sprain Brook 345 kV transmission line (*i.e.*, loop Y49 to proposed EGC 345 kV substation by building four East Garden City – proposed East Garden City 345 kV connections)
- Build three Valley Stream 138 kV – proposed Valley Stream 345 kV connections
- Build two Ruland Road – proposed Ruland Road 138 kV connections
- Build three Rainey – proposed Rainey 345 kV connections
- Build two Dunwoodie – proposed Dunwoodie 345 kV connections

- Build two Barrett – proposed Barrett 138 kV connections
- Build a proposed Newbridge Road 138 kV – Newbridge Road 345 kV connection
- Install one 345/138 kV transformer at the Newbridge Road 345/138 kV substation
- Install one 324 MVA PAR at the East Garden City 138 kV substation
- Install one breaker at the Ruland Road 138 kV substation
- Install shunt reactors for the proposed East Garden City – Dunwoodie 345 kV, proposed East Garden City – Sprain Brook 345 kV, proposed Ruland Road – Sprain Brook 345 kV, proposed East Garden City – proposed Valley Stream 345 kV, and proposed East Garden City – proposed Newbridge Road 345 kV transmission lines
- Upgrade terminal equipment at the West Bus 138 kV and Kings 138 kV substations
- Modify the reactor at the Elwood 138 kV substation to be two blocks of 40 MVAR
- Install a reactor at the Shore Road 138 kV substation to be five blocks of 50 MVAR
- Re-terminate Ruland Road 138 kV lines 562 and 662 at the proposed Ruland Road 138 kV substation
- Re-terminate Barrett – Valley Stream 138 kV lines 291 and 292 at the proposed Barrett 138 kV substation
- Re-terminate Dunwoodie – Pleasantville 345 kV lines W89 and W90 at the proposed Dunwoodie 345 kV substation
- Re-terminate Dunwoodie – Sprain Brook 345 kV line W75 at the proposed Dunwoodie 345 kV substation
- Re-terminate Mott Haven – Rainey East 345 kV transmission line to the proposed Rainey 345 kV substation
- Re-terminate Barrett – Freeport 138 kV line 459 to the proposed Barrett 138 kV substation
- Re-terminate the Barrett – Valley Stream line 292 to the Valley Stream 138 kV substation
- Re-terminate the Newbridge Road – Ruland Road 138 kV line 561 at the Newbridge Road 138 kV substation
- Re-terminate the Newbridge Road – Bethpage 138 kV line 563 at the Newbridge Road 138 kV substation
- Add two breaker-and-a-half bays at the existing Sprain Brook 345 kV substation
- Retire the Valley Stream 138 kV lines 261 and 262
- Retire the East Garden City – Newbridge Road 138 kV lines 465 and 467
- Modify the Newbridge Road 138 kV substation

Figure 2: T036 NextEra Core 1 Major Project Components (Refer to the description above for complete list of project components)

T037 NextEra Core 2

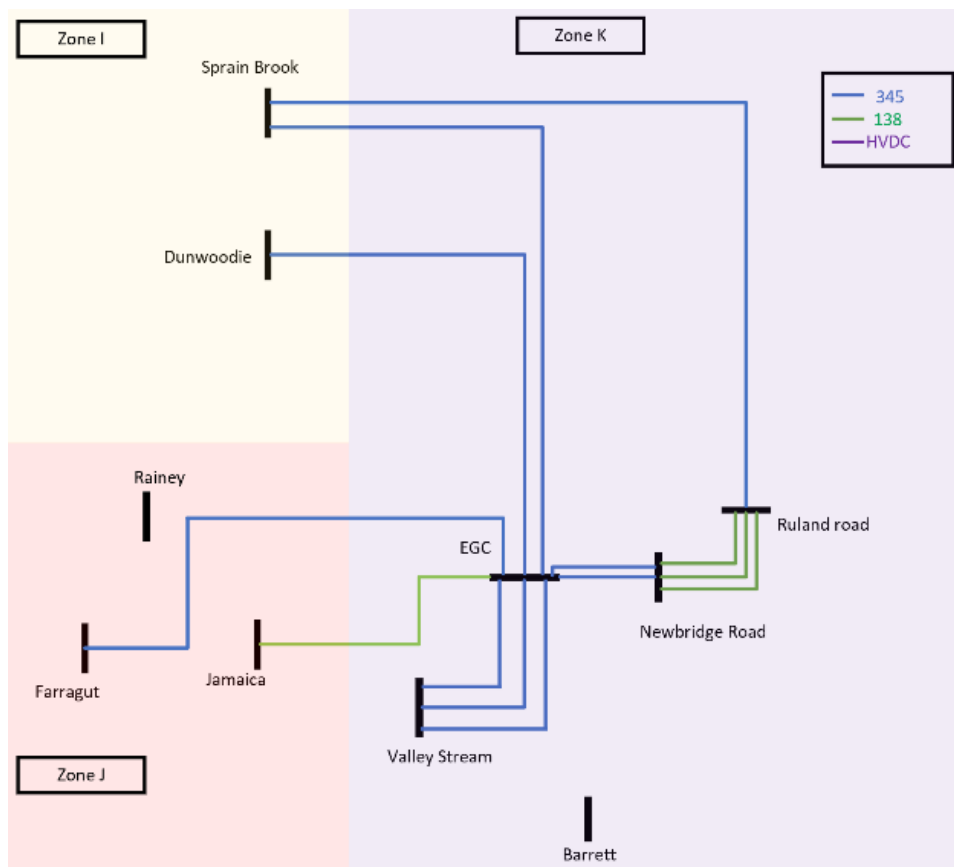

NextEra Core 2 proposal consists of the following components:

- Build a proposed East Garden City – proposed Farragut 345 kV transmission line
- Build a proposed East Garden City – Dunwoodie 345 kV transmission line
- Build a proposed East Garden City – Sprain Brook 345 kV transmission line
- Build a proposed Ruland Road – Sprain Brook 345 kV transmission line
- Build a PAR-controlled East Garden City – Jamaica 138 kV transmission line
- Build three proposed East Garden City – proposed Valley Stream 345 kV transmission lines
- Partial reconductor the Newbridge Road – Ruland Road 138 kV lines 561, 562, and 567
- Partial reconductor the Central Islip – Hauppauge 138 kV transmission line
- Rebuild the existing East Garden City – Newbridge Road 138 kV lines 462 and 463 as two 345 kV transmission lines from the proposed East Garden City substation to proposed Newbridge Road substation
- Partial rebuild of the Syosset – Oakwood 138 kV transmission line
- Partial rebuild of the Syosset – Greenlawn 138 kV transmission line
- Loop the Newbridge Road – Bagatelle 138 kV line 563 into the proposed Ruland Road 138 kV substation
- Modify the East Garden City – Sprain Brook 345 kV transmission line (i.e., loop Y49 to proposed EGC 345 kV substation by building four East Garden City – proposed East Garden City 345 kV connections)
- Build three Valley Stream 138 kV – proposed Valley Stream 345 kV connections
- Build two Ruland Road – proposed Ruland Road 138 kV connections
- Build three Rainey – proposed Rainey 345 kV connections
- Build two Dunwoodie – proposed Dunwoodie 345 kV connections
- Build two Barrett – proposed Barrett 138 kV connections
- Build two Farragut – proposed Farragut 345 kV connections
- Build a Newbridge Road 138 kV – Newbridge Road 345 kV connection
- Build an East Garden City 345 kV GIS substation with one 1050 MVA PAR regulating flow on the proposed East Garden City to proposed Farragut transmission line
- Build a Ruland Road 345/138 kV GIS substation with two 345/138 kV transformers and one 1050 MVA PAR regulating flow on the proposed Ruland Rd to Sprain Brook transmission line
- Build a Valley Stream 345 kV GIS substation with three 345/138 kV transformers

- Build a proposed Barrett 138 kV GIS substation with one PAR regulating flow on proposed East Garden City – Jamaica 138 kV transmission line
- Build a Rainey 345 kV GIS substation
- Build a Dunwoodie 345 kV GIS substation
- Build a Farragut 345 kV GIS substation
- Modify the existing Newbridge Road 345 kV substation to add two breaker-and-a-half GIS bays
- Install one 345/138 kV transformer at the Newbridge Road 345/138 kV substation
- Install one 324 MVA PAR at the East Garden City 138 kV substation
- Install one breaker at the Ruland Road 138 kV substation
- Install shunt reactors at the proposed East Garden City – Dunwoodie 345 kV, proposed East Garden City – Sprain Brook 345 kV, proposed East Garden City – proposed Farragut 345 kV, proposed Ruland Road – Sprain Brook 345 kV, proposed East Garden City – proposed Valley Stream 345 kV, and proposed East Garden City – proposed Newbridge Road 345 kV transmission lines
- Terminal upgrades at the West Bus 138 kV and Kings 138 kV substations
- Modify the reactor at the Elwood 138 kV substation to be two blocks of 40 MVAR
- Install reactor at the Shore Road 138 kV substation to be five blocks of 50 MVAR
- Re-terminate the Ruland Road 138 kV lines 562 and 662 at the proposed Ruland Road 138 kV substation
- Re-terminate the Barrett – Valley Stream 138 kV lines 291 and 292 at the proposed Barrett 138 kV substation
- Re-terminate the Dunwoodie – Pleasantville 345 kV lines W89 and W90 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Dunwoodie – Sprain Brook 345 kV line W75 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Mott Haven – Rainey East 345 kV transmission line at the proposed Rainey 345 kV substation
- Re-terminate the Barrett – Freeport 138 kV line 459 at the proposed Barrett 138 kV substation
- Re-terminate the Barrett – Valley Stream line 292 at the Valley Stream 138 kV substation
- Re-terminate the Newbridge Road – Ruland Road 138 kV line 561 at the Newbridge Road 138 kV substation
- Re-terminate the Newbridge Road – Bethpage 138 kV line 563 at the Newbridge Road 138 kV substation

- Install two breaker-and-a-half bays at the existing Sprain Brook 345 kV substation
- Retire Valley Stream 138 kV lines 261 and 262
- Retire the East Garden City – Newbridge Road 138 kV lines 465 and 467
- Modify the Newbridge Road 138 kV substation

Figure 3: T037 NextEra Core 2 Major Project Components (Refer to the description above for complete list of project components)

T038 NextEra Core 3

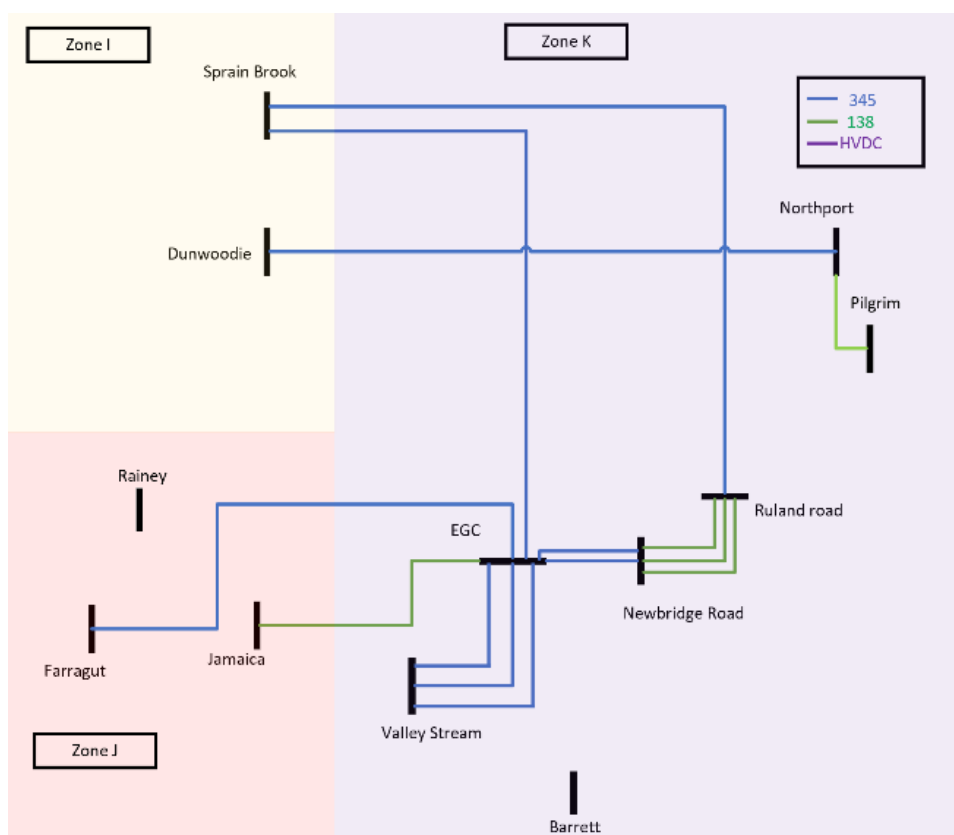

NextEra Core 3 proposal consists of the following components:

- Build a proposed East Garden City 345 kV substation with two 1050 MVA PARs regulating flow on the East Garden City – Sprain Brook and East Garden City – Farragut transmission lines
- Build a proposed Ruland Road 345/138 kV substation with two 345/138 kV transformers and one 1050 MVA PAR regulating flow on the Ruland Road – Sprain Brook transmission line
- Build a proposed Valley Stream 345 kV substation with three 345/138 kV transformers
- Build a proposed Northport 345/138 kV substation with two 345/138 kV transformers
- Build a proposed Barrett 138 kV substation with one PAR regulating flow on proposed East Garden City – Jamaica 138 kV transmission line
- Build a proposed Rainey 345 kV substation
- Build a proposed Dunwoodie 345 kV substation
- Build a proposed Farragut 345 kV substation
- Modify the existing Newbridge Road 345 kV to add two breaker-and-a-half GIS bays
- Build a proposed East Garden City – proposed Farragut 345 kV transmission line
- Build a proposed Northport – Dunwoodie 345 kV transmission line
- Build a proposed East Garden City – Sprain Brook 345 kV transmission line
- Build a proposed Ruland Road – Sprain Brook 345 kV transmission line
- Build a proposed PAR controlled East Garden City – Jamaica 138 kV transmission line
- Build three East Garden City – proposed Valley Stream 345 kV transmission lines
- Partially reconductor the Newbridge Road – Ruland Road 138 kV lines 561, 562, and 567
- Partially reconductor the Central Islip – Hauppauge 138 kV transmission line
- Rebuild the existing East Garden City – Newbridge Road 138 kV lines 462 and 463 as two 345 kV transmission lines from the proposed East Garden City – proposed Newbridge Road 345 kV transmission lines
- Loop the Newbridge Road – Bagatelle 138 kV line 563 into the proposed Ruland Road 138 kV substation
- Modify the East Garden City – Sprain Brook 345 kV transmission line (i.e., loop Y49 to proposed EGC 345 kV substation by building four East Garden City – proposed East Garden City 345 kV connections)
- Build three Valley Stream 138 kV – proposed Valley Stream 345 kV connections
- Build two Ruland Road – proposed Ruland Road 138 kV connections
- Build three Rainey – proposed Rainey 345 kV connections

- Build two Dunwoodie – proposed Dunwoodie 345 kV connections
- Build two Barrett – proposed Barrett 138 kV connections
- Build two Farragut – proposed Farragut 345 kV connections
- Build two proposed Northport 138 kV – proposed Northport 345 kV connections
- Build two Northport – proposed Northport 138 kV connections
- Build a proposed Newbridge Road 138 kV – Newbridge Road 345 kV connection
- Build a proposed Pilgrim – proposed Northport 138 kV transmission line
- Install one 345/138 kV transformer at the Newbridge Road 345/138 kV substation
- Install one 324 MVA PAR at the East Garden City 138 kV substation
- Install one breaker at the Ruland Road 138 kV substation
- Install one breaker at the Pilgrim 138 kV substation
- Install shunt reactors for the proposed Northport – Dunwoodie 345 kV, proposed East Garden City – Sprain Brook 345 kV, proposed East Garden City – proposed Farragut 345 kV, proposed Ruland Road – Sprain Brook 345 kV, proposed East Garden City – proposed Valley Stream 345 kV, and proposed East Garden City – proposed Newbridge Road 345 kV transmission lines
- Terminal upgrades at the West Bus 138 kV and Kings 138 kV substations
- Modify the reactor at the Elwood 138 kV substation to be two blocks of 40 MVAR
- Install a reactor at the Shore Road 138 kV substation, consisting of five blocks of 50 MVAR
- Re-terminate the Northport – Pilgrim 138 kV lines 672, 677, and 679 at the proposed Northport 138 kV substation
- Re-terminate the Ruland Road 138 kV lines 562 and 662 at the proposed Ruland Road 138 kV substation
- Re-terminate the Barrett – Valley Stream 138 kV lines 291 and 292 at the proposed Barrett 138 kV substation
- Re-terminate the Dunwoodie – Pleasantville 345 kV lines W89 and W90 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Dunwoodie – Sprain Brook 345 kV line W75 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Mott Haven – Rainey East 345 kV transmission line at the proposed Rainey 345 kV substation
- Re-terminate the Barrett – Freeport 138 kV line 459 at the proposed Barrett 138 kV substation
- Re-terminate the Barrett – Valley Stream line 292 at Valley Stream 138 kV substation

- Re-terminate the Newbridge Road – Ruland Road 138 kV line 561 at the Newbridge Road 138 kV substation
- Re-terminate the Newbridge Road – Bethpage 138 kV line 563 at the Newbridge Road 138 kV substation
- Add two breaker-and-a-half bays at the existing Sprain Brook 345 kV substation
- Retire the Valley Stream 138 kV lines 261 and 262
- Retire the East Garden City – Newbridge Road 138 kV lines 465 and 467
- Modify the Newbridge Road 138 kV substation

Figure 4: T038 NextEra Core 3 Major Project Components (Refer to the description above for complete list of project components)

T039 NextEra Core 4

NextEra Core 4 proposal consists of the following components:

- Build a proposed Farragut – Sprain Brook 345 kV transmission line
- Build a proposed Northport – Dunwoodie 345 kV transmission line
- Build a proposed East Garden City – Sprain Brook 345 kV transmission line
- Build a proposed Ruland Road – Sprain Brook 345 kV transmission line
- Build a PAR-controlled East Garden City – Jamaica 138 kV transmission line
- Build three proposed East Garden City – proposed Valley Stream 345 kV transmission lines
- Partial reconductor the Newbridge Road – Ruland Road 138 kV line 561, 562, and 567
- Partial reconductor the Central Islip – Hauppauge 138 kV transmission line
- Rebuild the existing East Garden City – Newbridge Road 138 kV line 462 and 463 as two 345 kV transmission lines from the proposed East Garden City substation to proposed Newbridge Road substation
- Partial rebuild of the Syosset – Oakwood 138 kV transmission line
- Partial rebuild of the Syosset – Greenlawn 138 kV transmission line
- Loop the Newbridge Road – Bagatelle 138 kV line 563 into the proposed Ruland Road 138 kV substation
- Modify the East Garden City – Sprain Brook 345 kV transmission line (i.e., loop Y49 to proposed EGC 345 kV substation by building four East Garden City – proposed East Garden City 345 kV connections)
- Build three Valley Stream 138 kV – proposed Valley Stream 345 kV connections
- Build two Ruland Road – proposed Ruland Road 138 kV connections
- Build three Rainey – proposed Rainey 345 kV connections
- Build two Dunwoodie – proposed Dunwoodie 345 kV connections
- Build two Barrett – proposed Barrett 138 kV connections
- Build two Farragut – proposed Farragut 345 kV connections
- Build two proposed Northport 138 kV – proposed Northport 345 kV connections
- Build two Northport – proposed Northport 138 kV connections
- Build a Newbridge Road 138 kV – Newbridge Road 345 kV connection
- Build a Pilgrim – proposed Northport 138 kV transmission line
- Build an East Garden City 345 kV GIS substation with one 1050 MVA PAR at regulating flows on the proposed East Greenbush to Sprain Brook transmission line
- Build a Ruland Road 345/138 kV GIS substation with two 345/138 kV transformers

- Build a Valley Stream 345 kV GIS substation with three 345/138 kV transformers
- Build a Northport 345/138 kV GIS substation with two 345/138 kV transformers
- Build a proposed Barrett 138 kV GIS substation with one PAR regulating flow on the proposed East Garden City – Jamaica 138 kV transmission line
- Build a Rainey 345 kV GIS substation
- Build a Dunwoodie 345 kV GIS substation
- Build a Farragut 345 kV GIS substation
- Modify the existing Newbridge Road 345 kV substation to add two breaker-and-a-half GIS bays
- Install one 345/138 kV transformer at the Newbridge Road 345/138 kV substation
- Install one 324 MVA PAR at the East Garden City 138 kV substation
- Install one breaker at the Ruland Road 138 kV substation
- Install one breaker at the Pilgrim 138 kV substation
- Install shunt reactors at the proposed Northport – Dunwoodie 345 kV, proposed East Garden City – Sprain Brook 345 kV, proposed Ruland Road – Sprain Brook 345 kV, proposed Farragut – Sprain Brook 345 kV, proposed East Garden City – proposed Valley Stream 345 kV, and proposed East Garden City – proposed Newbridge Road 345 kV transmission lines
- Terminal upgrades at the West Bus 138 kV and Kings 138 kV substations
- Modify the reactor at the Elwood 138 kV substation to be two blocks of 40 MVAR
- Install reactor at the Shore Road 138 kV substation to be five blocks of 50 MVAR
- Re-terminate the Northport – Pilgrim 138 kV line 672, 677, and 679 to the proposed Northport 138 kV substation
- Re-terminate the Ruland Road 138 kV lines 562 and 662 at the proposed Ruland Road 138 kV substation
- Re-terminate the Barrett – Valley Stream 138 kV lines 291 and 292 at the proposed Barrett 138 kV substation
- Re-terminate the Dunwoodie – Pleasantville 345 kV lines W89 and W90 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Dunwoodie – Sprain Brook 345 kV line W75 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Mott Haven – Rainey East 345 kV transmission line to the proposed Rainey 345 kV substation
- Re-terminate the Barrett – Freeport 138 kV line 459 to the proposed Barrett 138 kV substation
- Re-terminate the Barrett – Valley Stream line 292 at the Valley Stream 138 kV substation

- Re-terminate the Newbridge Road – Ruland Road 138 kV line 561 at the Newbridge Road 138 kV substation
- Re-terminate the Newbridge Road – Bethpage 138 kV line 563 at the Newbridge Road 138 kV substation
- Add two breaker-and-a-half bays to the existing Sprain Brook 345 kV substation
- Retire the Valley Stream 138 kV lines 261 and 262
- Retire the East Garden City – Newbridge Road 138 kV lines 465 and 467
- Modify the Newbridge Road 138 kV substation

Figure 5: T039 NextEra Core 4 Major Project Components (Refer to the description above for complete list of project components)

T040 NextEra Core 5

NextEra Core 5 proposal consists of the following components:

- Build a proposed East Garden City 345 kV substation with one 1050 MVA PAR regulating flow on the East Garden City – Sprain Brook transmission line
- Build a proposed Ruland Road 345/138 kV substation with two 345/138 kV transformers
- Build a proposed Valley Stream 345 kV substation with three 345/138 kV transformers
- Build a proposed Northport 345/138 kV substation with two 345/138 kV transformers
- Build a proposed Barrett 138 kV substation with one PAR regulating flow on proposed East Garden City – Jamaica 138 kV transmission line
- Build a proposed Rainey 345 kV substation
- Build a proposed Dunwoodie 345 kV substation
- Add two breaker-and-a-half GIS bays to the existing Newbridge Road 345 kV substation
- Build a proposed Northport – Dunwoodie 345 kV transmission line
- Build a proposed East Garden City – Sprain Brook 345 kV transmission line
- Build a proposed Ruland Road – Sprain Brook 345 kV transmission line
- Build a proposed PAR-controlled East Garden City – Jamaica 138 kV transmission line
- Partially reconductor the Newbridge Road – Ruland Road 138 kV lines 561, 562, and 567
- Partially reconductor the Central Islip – Hauppauge 138 kV transmission line
- Rebuild the existing East Garden City – Newbridge Road 138 kV lines 462 and 463 as proposed East Garden City – proposed Newbridge Road 345 kV transmission lines
- Loop the Newbridge Road – Bagatelle 138 kV line 563 into the proposed Ruland Road 138 kV substation
- Modify the East Garden City – Sprain Brook 345 kV transmission line (i.e., loop Y49 to proposed EGC 345 kV substation by building four East Garden City – proposed East Garden City 345 kV connections)
- Build three Valley Stream 138 kV – proposed Valley Stream 345 kV connections
- Build two Ruland Road – proposed Ruland Road 138 kV connections
- Build three Rainey – proposed Rainey 345 kV connections
- Build two Dunwoodie – proposed Dunwoodie 345 kV connections
- Build two Barrett – proposed Barrett 138 kV connections
- Build two proposed Northport 138 kV – proposed Northport 345 kV connections
- Build two Northport – proposed Northport 138 kV connections
- Build a proposed Newbridge Road 138 kV – Newbridge Road 345 kV connection

- Install one 345/138 kV transformer at the Newbridge Road 345/138 kV substation
- Install one 324 MVA PAR at the East Garden City 138 kV substation
- Install one breaker at the Ruland Road 138 kV substation
- Install shunt reactors at the proposed Northport – Dunwoodie 345 kV, proposed East Garden City – Sprain Brook 345 kV, proposed Ruland Road – Sprain Brook 345 kV, proposed East Garden City – proposed Valley Stream 345 kV, and proposed East Garden City – proposed Newbridge Road 345 kV transmission lines
- Terminal upgrades at the West Bus 138 kV and Kings 138 kV substations
- Modify the reactor at the Elwood 138 kV substation to be two blocks of 40 MVAR
- Install a reactor at the Shore Road 138 kV substation to be five blocks of 50 MVAR
- Re-terminate the Northport – Pilgrim 138 kV line 672, 677, and 679 to the proposed Northport 138 kV substation
- Re-terminate the Ruland Road 138 kV lines 562 and 662 at the proposed Ruland Road 138 kV substation
- Re-terminate the Barrett – Valley Stream 138 kV lines 291 and 292 at the proposed Barrett 138 kV substation
- Re-terminate the Dunwoodie – Pleasantville 345 kV lines W89 and W90 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Dunwoodie – Sprain Brook 345 kV line W75 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Mott Haven – Rainey East 345 kV transmission line at the proposed Rainey 345 kV substation
- Re-terminate the Barrett – Freeport 138 kV line 459 at the proposed Barrett 138 kV substation
- Re-terminate the Barrett – Valley Stream line 292 at the Valley Stream 138 kV substation
- Re-terminate the Newbridge Road – Ruland Road 138 kV line 561 at the Newbridge Road 138 kV substation
- Re-terminate the Newbridge Road – Bethpage 138 kV line 563 at the Newbridge Road 138 kV substation
- Add two breaker-and-a-half bays to the existing Sprain Brook 345 kV substation
- Retire Valley Stream 138 kV lines 261 and 262
- Retire the East Garden City – Newbridge Road 138 kV lines 465 and 467
- Modify the Newbridge Road 138 kV substation

Figure 6: T040 NextEra Core 5 Major Project Components (Refer to the description above for complete list of project components)

T041 NextEra Core 6

NextEra Core 6 proposal consists of the following components:

- Build a Northport Converter Station – Sprain Brook Converter Station 320 kV DC line
- Build a proposed East Garden City – Dunwoodie 345 kV transmission line
- Build a proposed Ruland Road – Sprain Brook 345 kV transmission line
- Build a PAR-controlled East Garden City – Jamaica 138 kV transmission line
- Build three proposed East Garden City – proposed Valley Stream 345 kV transmission lines
- Partially reconductor the Newbridge Road – Ruland Road 138 kV lines 561, 562, and 567
- Partially reconductor the Central Islip – Hauppauge 138 kV transmission line
- Rebuild the existing East Garden City – Newbridge Road 138 kV lines 462 and 463 as two 345 kV transmission lines from the proposed East Garden City substation to proposed Newbridge Road substation
- Partially rebuild the Syosset – Oakwood 138 kV transmission line
- Partially rebuild the Syosset – Greenlawn 138 kV transmission line
- Loop the Newbridge Road – Bagatelle 138 kV line 563 into the proposed Ruland Road 138 kV substation
- Modify the East Garden City – Sprain Brook 345 kV transmission line (i.e., loop Y49 to proposed EGC 345 kV substation by building four East Garden City – proposed East Garden City 345 kV connections)
- Build three Valley Stream 138 kV – proposed Valley Stream 345 kV connections
- Build two Ruland Road – proposed Ruland Road 138 kV connections
- Build three Rainey – proposed Rainey 345 kV connections
- Build two Dunwoodie – proposed Dunwoodie 345 kV connections
- Build two Barrett – proposed Barrett 138 kV connections
- Build three Northport Converter Station – proposed Northport 138 kV transmission lines
- Build a Sprain Brook Converter Station – Sprain Brook 345 kV transmission line
- Build two Northport – proposed Northport 138 kV connections
- Build a Newbridge Road 138 kV – Newbridge Road 345 kV connection
- Build a Pilgrim – proposed Northport 138 kV transmission line
- Build an East Garden City 345 kV GIS substation with one 1050 MVA PAR regulating flow on the proposed East Garden City to Dunwoodie transmission line
- Build a Ruland Road 345/138 kV GIS substation with two 345/138 kV transformers
- Build a Valley Stream 345 kV GIS substation with three 345/138 kV transformers

- Build a Northport Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a Sprain Brook Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a proposed Barrett 138 kV GIS substation with one PAR regulating flow on the proposed East Garden City – Jamaica 138 kV transmission line
- Build a Rainey 345 kV GIS substation
- Build a Dunwoodie 345 kV GIS substation
- Build a Northport 138 kV GIS substation
- Add two breaker-and-a-half GIS bays to the existing Newbridge Road 345 kV substation
- Install one 345/138 kV transformer at the Newbridge Road 345/138 kV substation
- Install one 324 MVA PAR at the East Garden City 138 kV substation
- Install one breaker at the Ruland Road 138 kV substation
- Install one breaker at the Pilgrim 138 kV substation
- Install shunt reactors at the proposed East Garden City – Dunwoodie 345 kV, proposed Ruland Road – Sprain Brook 345 kV, proposed East Garden City – proposed Valley Stream 345 kV, and proposed East Garden City – proposed Newbridge Road 345 kV transmission lines
- Terminal upgrades at the West Bus 138 kV and Kings 138 kV substations
- Modify the reactor at the Elwood 138 kV substation to be two blocks of 40 MVAR
- Install reactor at the Shore Road 138 kV substation to be five blocks of 50 MVAR
- Re-terminate the Northport – Pilgrim 138 kV lines 672, 677, and 679 at the proposed Northport 138 kV substation
- Re-terminate the Ruland Road 138 kV lines 562 and 662 at the proposed Ruland Road 138 kV substation
- Re-terminate the Barrett – Valley Stream 138 kV lines 291 and 292 at the proposed Barrett 138 kV substation
- Re-terminate the Dunwoodie – Pleasantville 345 kV lines W89 and W90 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Dunwoodie – Sprain Brook 345 kV line W75 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Mott Haven – Rainey East 345 kV transmission line at the proposed Rainey 345 kV substation
- Re-terminate the “901” PAR transmission line at the East Garden City 138 kV substation
- Re-terminate the Barrett – Freeport 138 kV line 459 at the proposed Barrett 138 kV substation
- Re-terminate the Barrett – Valley Stream line 292 at the Valley Stream 138 kV substation

- Re-terminate the Newbridge Road – Ruland Road 138 kV line 561 at the Newbridge Road 138 kV substation
- Re-terminate the Newbridge Road – Bethpage 138 kV line 563 at the Newbridge Road 138 kV substation
- Add two breaker-and-a-half bays at the existing Sprain Brook 345 kV substation
- Retire the Valley Stream 138 kV lines 261 and 262
- Retire the East Garden City – Newbridge Road 138 kV lines 465 and 467
- Modify the Newbridge Road 138 kV substation

Figure 7: T041 NextEra Core 6 Major Project Components (Refer to the description above for complete list of project components)

T042 NextEra Core 7

NextEra Core 7 proposal consists of the following components:

- Build a proposed East Garden City – Dunwoodie 345 kV transmission line
- Build a proposed East Garden City – Sprain Brook 345 kV transmission line
- Build a proposed East Garden City – proposed Farragut 345 kV transmission line
- Build a proposed Ruland Road – Sprain Brook 345 kV transmission line
- Build an East Garden City – Jamaica 138 kV transmission line (includes a “905” PAR)
- Build a proposed Farragut – Sprain Brook 345 kV transmission line
- Build a Barrett Converter Station – Buchanan Converter Station 320 kV DC line
- Build a Northport Converter Station – Sprain Brook Converter Station 320 kV DC line
- Build three proposed East Garden City – proposed Valley Stream 345 kV transmission lines
- Partially reconductor the Newbridge Road – Ruland Road 138 kV lines 561, 562, and 567
- Partially reconductor the Central Islip – Hauppauge 138 kV transmission line
- Rebuild the existing East Garden City – Newbridge Road 138 kV lines 462 and 463 as two 345 kV transmission lines from the proposed East Garden City substation to the proposed Newbridge Road substation
- Partially rebuild the Syosset – Oakwood 138 kV transmission line
- Partially rebuild the Syosset – Greenlawn 138 kV transmission line
- Loop the Newbridge Road – Bagatelle 138 kV line 563 into the proposed Ruland Road 138 kV substation
- Modify the East Garden City – Sprain Brook 345 kV transmission line (i.e., loop Y49 to proposed EGC 345 kV substation by building four East Garden City – proposed East Garden City 345 kV connections)
- Build three Valley Stream 138 kV – proposed Valley Stream 345 kV connections
- Build two Ruland Road – proposed Ruland Road 138 kV connections
- Build three Rainey – proposed Rainey 345 kV connections
- Build two Dunwoodie – proposed Dunwoodie 345 kV connections
- Build two Barrett – proposed Barrett 138 kV connections
- Build two Farragut – proposed Farragut 345 kV connections
- Build three Northport Converter Station – proposed Northport 138 kV transmission lines
- Build a Sprain Brook Converter Station – Sprain Brook 345 kV transmission line
- Build two Northport – proposed Northport 138 kV connections
- Build a Newbridge Road 138 kV – Newbridge Road 345 kV connection

- Build a Pilgrim – proposed Northport 138 kV transmission line
- Build a Holbrook – Pilgrim 138 kV transmission line
- Build three Barrett Converter Station – proposed Barrett 138 kV transmission lines
- Build a Buchanan Converter Station – Buchanan 345 kV transmission line
- Build an East Garden City 345 kV GIS substation with two 1050 MVA PARs regulating flows on the East Garden City to Farragut and East Garden City to Sprain Brook transmission lines
- Build a Ruland Road 345/138 kV GIS substation with two 345/138 kV transformers and one 1050 MVA PAR regulating flows on the Ruland Rd to Sprain Brook transmission line
- Build a Valley Stream 345 kV GIS substation with three 345/138 kV transformers
- Build a Northport Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a Sprain Brook Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a Barrett Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a Buchanan Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a Barrett 138 kV GIS substation with one PAR regulating flow on the proposed East Garden City – Jamaica 138 kV transmission line
- Build a Rainey 345 kV GIS substation
- Build a Farragut 345 kV GIS substation
- Build a Dunwoodie 345 kV GIS substation
- Build a Northport 138 kV GIS substation
- Add two breaker-and-a-half GIS bays at the existing Newbridge Road 345 kV substation
- Install one 345/138 kV transformer at the Newbridge Road 345/138 kV substation
- Install one 324 MVA PAR at the East Garden City 138 kV substation
- Install one breaker at the Ruland Road 138 kV substation
- Install two breakers at the Pilgrim 138 kV substation
- Install shunt reactors at the proposed East Garden City – Sprain Brook 345 kV, proposed East Garden City – Dunwoodie 345 kV, proposed East Garden City – proposed Farragut 345 kV, proposed Ruland Road – Sprain Brook 345 kV, proposed Farragut – Sprain Brook 345 kV, proposed East Garden City – proposed Valley Stream 345 kV, and proposed East Garden City – proposed Newbridge Road 345 kV transmission lines
- Modify the reactor at the Elwood 138 kV substation to be two blocks of 40 MVAR
- Install a reactor at the Shore Road 138 kV substation to be five blocks of 50 MVAR
- Re-terminate the Northport – Pilgrim 138 kV lines 672, 677, and 679 at the proposed Northport 138 kV substation

- Re-terminate the Ruland Road 138 kV lines 562 and 662 at the proposed Ruland Road 138 kV substation
- Re-terminate the Barrett – Valley Stream 138 kV lines 291 and 292 at the proposed Barrett 138 kV substation
- Re-terminate the Dunwoodie – Pleasantville 345 kV lines W89 and W90 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Dunwoodie – Sprain Brook 345 kV line W75 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Mott Haven – Rainey East 345 kV transmission line at the proposed Rainey 345 kV substation
- Re-terminate the Barrett – Freeport 138 kV line 459 at the proposed Barrett 138 kV substation
- Re-terminate the Barrett – Valley Stream line 292 at the Valley Stream 138 kV substation
- Re-terminate the Newbridge Road – Ruland Road 138 kV line 561 at the Newbridge Road 138 kV substation
- Re-terminate the Newbridge Road – Bethpage 138 kV line 563 at the Newbridge Road 138 kV substation
- Add two breaker-and-a-half bays at the existing Sprain Brook 345 kV substation
- Retire the Valley Stream 138 kV lines 261 and 262
- Retire the East Garden City – Newbridge Road 138 kV lines 465 and 467
- Modify the Newbridge Road 138 kV substation

Figure 8: T042 NextEra Core 7 Major Project Components (Refer to the description above for complete list of project components)

T043 NextEra Enhanced 1

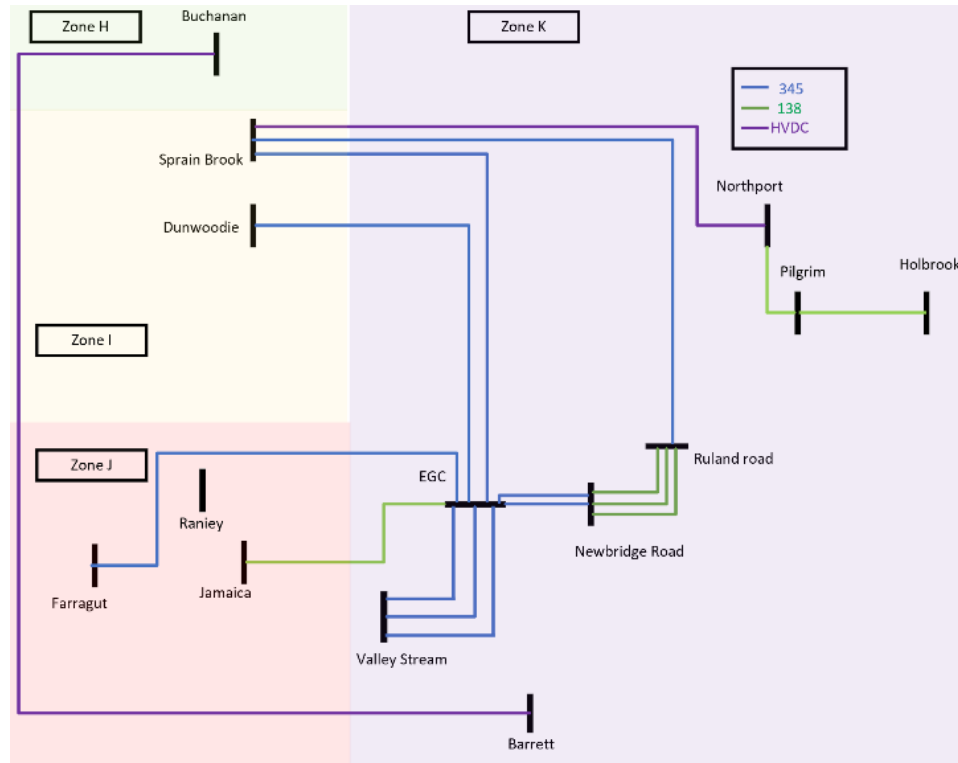

NextEra Enhanced 1 proposal consists of the following components:

- Build a proposed East Garden City – Dunwoodie 345 kV transmission line
- Build a proposed East Garden City – Sprain Brook 345 kV transmission line
- Build a proposed East Garden City – proposed Farragut 345 kV transmission line
- Build a proposed Ruland Road – Sprain Brook 345 kV transmission line
- Build a PAR-controlled East Garden City – Jamaica 138 kV transmission line
- Build a proposed Farragut – Sprain Brook 345 kV transmission line
- Build a Barrett Converter Station – Buchanan Converter Station 320 kV DC line
- Build a Northport Converter Station – Sprain Brook Converter Station 320 kV DC line
- Build three proposed East Garden City – proposed Valley Stream 345 kV transmission lines
- Partially reconductor the Newbridge Road – Ruland Road 138 kV lines 561, 562, and 567
- Partially reconductor the Central Islip – Hauppauge 138 kV transmission line
- Rebuild the existing East Garden City – Newbridge Road 138 kV lines 462 and 463 as two 345 kV transmission lines from the proposed East Garden City substation to proposed Newbridge Road substation
- Partially rebuild the Syosset – Oakwood 138 kV transmission line
- Partially rebuild the Syosset – Greenlawn 138 kV transmission line
- Loop the Newbridge Road – Bagatelle 138 kV line 563 into the proposed Ruland Road 138 kV substation
- Modify the East Garden City – Sprain Brook 345 kV transmission line (i.e., loop Y49 to proposed EGC 345 kV substation by building four East Garden City – proposed East Garden City 345 kV connections)
- Build three Valley Stream 138 kV – proposed Valley Stream 345 kV connections
- Build two Ruland Road – proposed Ruland Road 138 kV connections
- Build three Rainey – proposed Rainey 345 kV connections
- Build two Dunwoodie – proposed Dunwoodie 345 kV connections
- Build two Barrett – proposed Barrett 138 kV connections
- Build two Farragut – proposed Farragut 345 kV connections
- Build three Northport Converter Station – proposed Northport 138 kV transmission lines
- Build a Sprain Brook Converter Station – Sprain Brook 345 kV transmission line
- Build two Northport – proposed Northport 138 kV connections
- Build a Newbridge Road 138 kV – Newbridge Road 345 kV connection

- Build a Pilgrim – proposed Northport 138 kV transmission line
- Build a Holbrook – Pilgrim 138 kV transmission line
- Build three Barrett Converter Station – proposed Barrett 138 kV transmission lines
- Build a Buchanan Converter Station – Buchanan 345 kV transmission line
- Build an East Garden City 345 kV GIS substation with two 1050 MVA PARs regulating flows on the East Garden City to Farragut and East Garden City to Sprain Brook transmission lines
- Build a Ruland Road 345/138 kV GIS substation with two 345/138 kV transformers and one 1050 MVA PAR regulating flows on the Ruland Rd to Sprain Brook transmission line
- Build a Valley Stream 345 kV GIS substation with three 345/138 kV transformers
- Build a Northport Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a Sprain Brook Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a Barrett Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a Buchanan Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a proposed Barrett 138 kV GIS substation with one PAR regulating flow on the proposed East Garden City – Jamaica 138 kV transmission line
- Build a Rainey 345 kV GIS substation
- Build a Farragut 345 kV GIS substation
- Build a Dunwoodie 345 kV GIS substation
- Build a Northport 138 kV GIS substation
- Add two breaker-and-a-half GIS bays at the existing Newbridge Road 345 kV substation
- Install one 345/138 kV transformer at the Newbridge Road 345/138 kV substation
- Install one 324 MVA PAR at the East Garden City 138 kV substation
- Install one breaker at the Ruland Road 138 kV substation
- Install two breakers at the Pilgrim 138 kV substation
- Install shunt reactors at the proposed East Garden City – Sprain Brook 345 kV, proposed East Garden City – Dunwoodie 345 kV, proposed East Garden City – proposed Farragut 345 kV, proposed Ruland Road – Sprain Brook 345 kV, proposed Farragut – Sprain Brook 345 kV, proposed East Garden City – proposed Valley Stream 345 kV, and proposed East Garden City – proposed Newbridge Road 345 kV transmission lines
- Modify the reactor at the Elwood 138 kV substation to be two blocks of 40 MVAR
- Install reactor at the Shore Road 138 kV substation to be five blocks of 50 MVAR
- Re-terminate the Northport – Pilgrim 138 kV lines 672, 677, and 679 at the proposed Northport 138 kV substation

- Re-terminate the Ruland Road 138 kV lines 562 and 662 at the proposed Ruland Road 138 kV substation
- Re-terminate the Barrett – Valley Stream 138 kV lines 291 and 292 at the proposed Barrett 138 kV substation
- Re-terminate the Dunwoodie – Pleasantville 345 kV lines W89 and W90 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Dunwoodie – Sprain Brook 345 kV line W75 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Mott Haven – Rainey East 345 kV transmission line at the proposed Rainey 345 kV substation
- Re-terminate the Barrett – Freeport 138 kV line 459 at the proposed Barrett 138 kV substation
- Re-terminate the Barrett – Valley Stream line 292 at the Valley Stream 138 kV substation
- Re-terminate the Newbridge Road – Ruland Road 138 kV line 561 at the Newbridge Road 138 kV substation
- Re-terminate the Newbridge Road – Bethpage 138 kV line 563 at the Newbridge Road 138 kV substation
- Expand the existing Sprain Brook 345 kV substation by adding two breaker-and-a-half bays
- Retire the Valley Stream 138 kV lines 261 and 262
- Retire the East Garden City – Newbridge Road 138 kV lines 465 and 467
- Modify the Newbridge Road 138 kV substation

Figure 9: T043 NextEra Enhanced 1 Major Project Components (Refer to the description above for complete list of project components)

T044 NextEra Enhanced 2

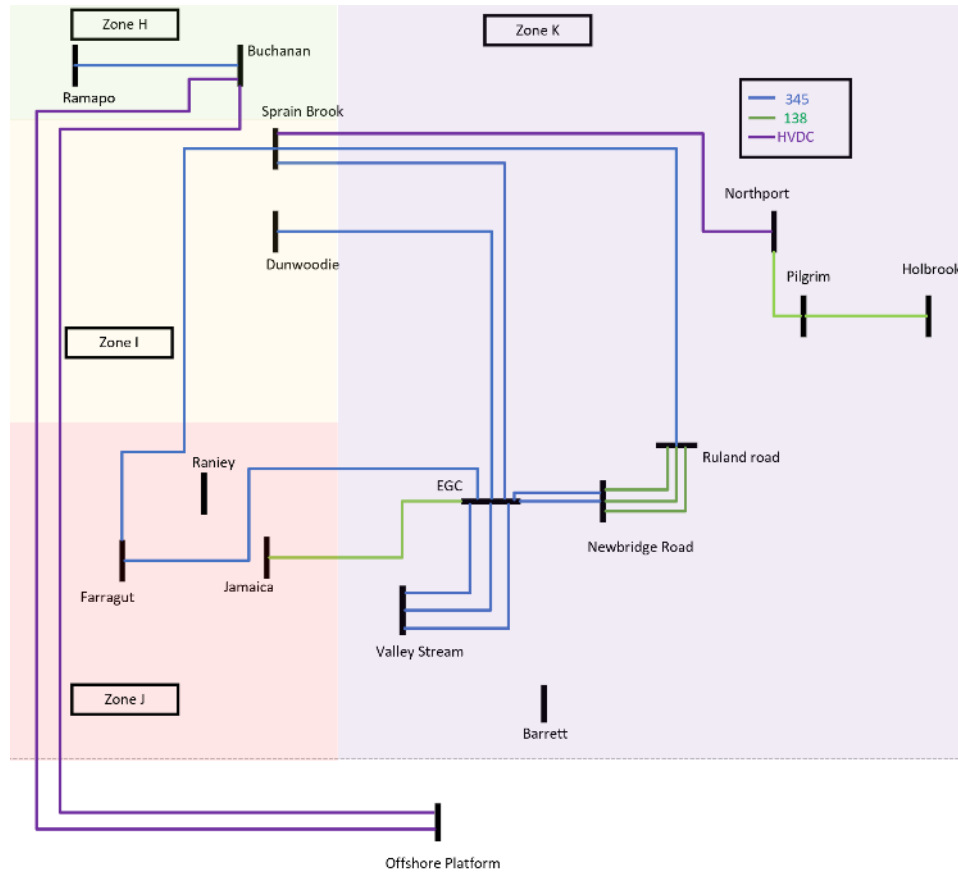

NextEra Enhanced 2 proposal consists of the following components:

- Build a proposed East Garden City – Dunwoodie 345 kV transmission line
- Build a proposed East Garden City – Sprain Brook 345 kV transmission line
- Build a proposed East Garden City – proposed Farragut 345 kV transmission line
- Build a proposed Ruland Road – Sprain Brook 345 kV transmission line
- Build a PAR-controlled East Garden City – Jamaica 138 kV transmission line
- Build a proposed Farragut – Sprain Brook 345 kV transmission line
- Build a Northport Converter Station – Sprain Brook Converter Station 320 kV DC line
- Build three proposed East Garden City – proposed Valley Stream 345 kV transmission lines
- Partially reconductor the Newbridge Road – Ruland Road 138 kV lines 561, 562, and 567
- Partially reconductor the Central Islip – Hauppauge 138 kV transmission line
- Rebuild the existing East Garden City – Newbridge Road 138 kV lines 462 and 463 as two 345 kV transmission lines from the proposed East Garden City substation to the proposed Newbridge Road substation
- Partially rebuild the Syosset – Oakwood 138 kV transmission line
- Partially rebuild the Syosset – Greenlawn 138 kV transmission line
- Partially rebuild the Newbridge – Locust Grove 138 kV transmission line
- Loop the Newbridge Road – Bagatelle 138 kV line 563 into the proposed Ruland Road 138 kV substation
- Modify the East Garden City – Sprain Brook 345 kV transmission line (i.e., loop Y49 to proposed EGC 345 kV substation by building four East Garden City – proposed East Garden City 345 kV connections)
- Build three Valley Stream 138 kV – proposed Valley Stream 345 kV connections
- Build two Ruland Road – proposed Ruland Road 138 kV connections
- Build three Rainey – proposed Rainey 345 kV connections
- Build two Dunwoodie – proposed Dunwoodie 345 kV connections
- Build two Barrett – proposed Barrett 138 kV connections
- Build two Farragut – proposed Farragut 345 kV connections
- Build three Northport Converter Station – proposed Northport 138 kV transmission lines
- Build a Sprain Brook Converter Station – Sprain Brook 345 kV transmission line
- Build two Northport – proposed Northport 138 kV connections
- Build a Newbridge Road 138 kV – Newbridge Road 345 kV connection

- Build a Pilgrim – proposed Northport 138 kV transmission line
- Build a Holbrook – Pilgrim 138 kV transmission line
- Build two Offshore Platform – Buchanan Converter Station (1,200 MW HVDC Symmetrical Monopole) transmission lines
- Build two Buchanan Converter Station – Buchanan 345 kV transmission lines
- Build two proposed Buchanan – Buchanan 345 kV connections
- Build a proposed Buchanan – Ramapo 345 kV transmission line
- Build a Corona – Jamaica 138 kV transmission line with one 283 MVA PAR
- Build an East Garden City 345 kV GIS substation with two 1050 MVA PARs regulating flows on the East Garden City to Farragut and East Garden City to Sprain Brook transmission lines
- Build a Ruland Road 345/138 kV GIS substation with two 345/138 kV transformers and one 1050 MVA PAR regulating flows on the Ruland Rd to Sprain Brook transmission line
- Build a Valley Stream 345 kV GIS substation with three 345/138 kV transformers
- Build a Northport Converter Station (1,200 MW HVDC VSC Converter Station)
- Build a Sprain Brook Converter Station (1,200 MW HVDC VSC Converter Station)
- Build two Buchanan Converter Stations (1,200 MW HVDC VSC Converter Station x 2)
- Build two Offshore Converter Stations to deliver energy from future offshore wind generators to the proposed Buchanan 345 kV substation
- Build a Buchanan 345 kV GIS substation with two PARs
- Build a proposed Barrett 138 kV GIS substation with one PAR regulating flow on the proposed East Garden City – Jamaica 138 kV transmission line
- Build a Rainey 345 kV GIS substation
- Build a Farragut 345 kV GIS substation
- Build a Dunwoodie 345 kV GIS substation
- Build a Northport 138 kV GIS substation
- Add two breaker-and-a-half GIS bays at the existing Newbridge Road 345 kV substation
- Install two 1050 MVA PARs at the Buchanan 345 kV substation on the line to Eastview
- Install one PAR with summer rating of 283 MVA at the Corona 138 kV substation
- Install one 345/138 kV transformer at the Newbridge Road 345/138 kV substation
- Install one 324 MVA PAR at the East Garden City 138 kV substation
- Install one breaker at the Ruland Road 138 kV substation
- Install two breakers at the Pilgrim 138 kV substation

- Install shunt reactors at the proposed East Garden City – Sprain Brook 345 kV, proposed East Garden City – Dunwoodie 345 kV, proposed East Garden City – proposed Farragut 345 kV, proposed Ruland Road – Sprain Brook 345 kV, proposed Farragut – Sprain Brook 345 kV, proposed Buchanan substation – Ramapo 345 kV, proposed East Garden City – proposed Valley Stream 345 kV, and proposed East Garden City – proposed Newbridge Road 345 kV
- Modify the reactor at the Elwood 138 kV substation to be two blocks of 40 MVAR
- Install a reactor at the Shore Road 138 kV substation to be five blocks of 50 MVAR
- Re-terminate the Northport – Pilgrim 138 kV lines 672, 677, and 679 at the proposed Northport 138 kV substation
- Re-terminate the Ruland Road 138 kV lines 562 and 662 at the proposed Ruland Road 138 kV substation
- Re-terminate the Barrett – Valley Stream 138 kV lines 291 and 292 at the proposed Barrett 138 kV substation
- Re-terminate the Mott Haven – Rainey East 345 kV transmission line at the proposed Rainey 345 kV substation
- Re-terminate the Dunwoodie – Pleasantville 345 kV lines W89 and W90 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Dunwoodie – Sprain Brook 345 kV line W75 at the proposed Dunwoodie 345 kV substation
- Re-terminate the Eastview – Buchanan (North) “W93” transmission line at the proposed Buchanan 345 kV substation
- Re-terminate the Millwood West – Buchanan (South) “W97” transmission line at the proposed Buchanan 345 kV substation
- Re-terminate the Barrett – Freeport 138 kV line 459 at the proposed Barrett 138 kV substation
- Re-terminate the Barrett – Valley Stream line 292 at the Valley Stream 138 kV substation
- Re-terminate the Newbridge Road – Ruland Road 138 kV line 561 at the Newbridge Road 138 kV substation
- Re-terminate the Newbridge Road – Bethpage 138 kV line 563 at the Newbridge Road 138 kV substation
- Add two breaker-and-a-half bays at the existing Sprain Brook 345 kV substation
- Retire the Valley Stream 138 kV line 261 and 262
- Retire the East Garden City – Newbridge Road 138 kV line 465 and 467
- Modify the Newbridge Road 138 kV substation

Figure 10: T044 NextEra Enhanced 2 Major Project Components (Refer to the description above for complete list of project components)

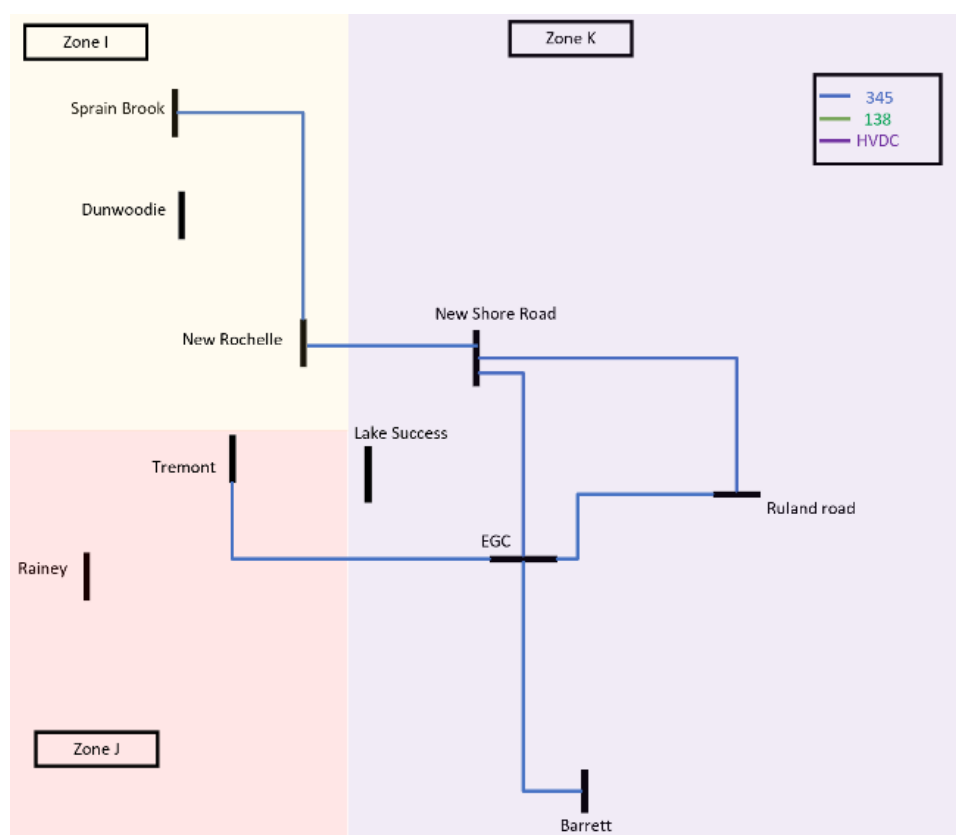

T047 Propel Base Solution 1

Propel Base Solution 1 proposal consists of the following components:

- Build a proposed Barrett 345 kV substation with two 345/138 kV transformers in series with 138 kV 540 MVA PARs controlling flow towards Barrett and one 100 MVAR shunt reactor
- Build a proposed New Shore Road 345 kV station with one 345 kV 900 MVA PAR controlling flow towards the New Rochelle 345 kV station, one 345/138 kV transformer in series with a 138 kV 540 MVA PAR controlling flow towards the existing Shore Road 345/138 kV substation, and two 150 MVAR shunt reactors
- Build a proposed Ruland Road 345 kV substation in a ring configuration with three 345/138 kV transformers to connect to the existing Ruland Road 138 kV substation, one 345 kV 650 MVA PAR controlling flow towards the East Garden City 345 kV substation; and two 150 MVAR shunt reactors
- Build a proposed New Rochelle 345 kV transition station
- Build a proposed underground Barrett – East Garden City 345 kV AC line
- Build a proposed PAR-controlled 345 kV tie line from East Garden City 345 kV substation interconnected to the existing Tremont 345 kV substation
- Build a proposed underground/submarine Ruland Road – New Shore Road – New Rochelle-Sprain Brook 345 kV AC line
- Convert and reconfigure the existing Ruland Road – New Bridge 138 kV circuit 3 and New Bridge – East Garden City 138 kV circuit 4 to a Ruland Road – East Garden City 345 kV line, bypassing the existing New Bridge 138 kV substation
- Install PASS Breakers in place of breakers 1E and 6E at the existing Rainey 345 kV substation
- Modify the East Garden City 345 kV substation to a breaker-and-a-half configuration with a PAR-controlled connection of the existing Y-49 345 kV line (i.e., the two existing Y49 345/138 kV transformers will be used to connect the East Garden City 345 kV substation to the existing East Garden City 138 kV substation)
- Install one 120 MVAR shunt reactor and one 300 MVAR shunt reactor at the East Garden City 345 kV substation.
- Install one 100 MVAR switch shunt reactor at the Sprain Brook 345 kV substation
- Install two series reactors on the Ruland Road – New Bridge 138 kV circuit 1 & circuit 2 at the Ruland Road substation
- Install two series reactors on the East Garden City – New Bridge 138 kV circuit 1 & circuit 2 at the East Garden City substation

- Install PASS breakers (i.e., two breakers in series) in place of breaker CB-1460 at the existing New Bridge 138 kV substation to address the stuck breaker fault
- Install a new circuit breaker between the Holbrook 138/69 kV transformers 2 & 2A and the Holbrook – Ruland Road 138 kV line (Line 138-882) at the existing Holbrook 138 kV substation
- Upgrade Central Islip-Hauppauge 138 kV line (Line 138-889)
- Modify relay systems to eliminate P5 contingencies at multiple substations, including Valley Stream 138 kV substation, Lake Success 138 kV substation, East Garden City 138 kV substation, and Barrett 138 kV substation

Figure 11: T047 Propel Base Solution 1 Major Project Components (Refer to the description above for complete list of project components)

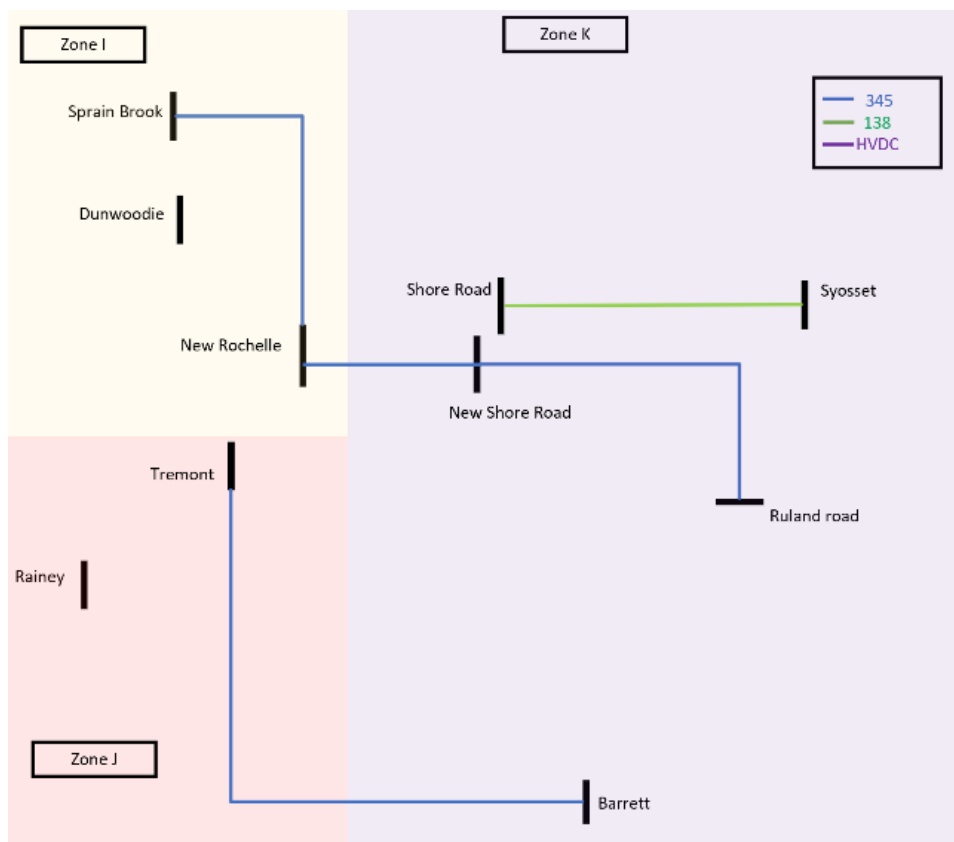

T048 Propel Base Solution 2

Propel Base Solution 2 proposal consists of the following components:

- Build a proposed Barrett 345/138 kV substation in a ring configuration connecting to the proposed 138 kV Barrett substation to accommodate offshore wind projects with three 345/138 transformers, one 345 kV 900 MVA PAR controlling flow to Tremont, and one 300 MVAR shunt reactor
- Build a proposed New Shore Road 345 kV transition station together with one 200 MVAR shunt reactor
- Build a proposed Ruland Road 345/138 kV substation in ring configuration interconnecting to existing Ruland Road 138 kV substation with three 345/138 kV transformers, one 345 kV 900 MVA PAR controlling flow towards the proposed New Shore Road 345 kV substation, and one 200 MVAR shunt reactor
- Build a proposed New Rochelle 345 kV transition station
- Build a proposed underground Barrett – Tremont 345 kV AC line
- Build a proposed underground/submarine Ruland Road – New Shore Road – New Rochelle – Sprain Brook 345 kV AC line
- Build a Syosset – Shore Rd 138 kV land cable with one 138 kV 517 MVA PAR at the Syosset 138 kV substation
- Install a PASS breaker in place of breaker 1E at the existing Rainey 345 kV substation
- Install one 150 MVAR switch shunt reactor at the existing Sprain Brook 345 kV substation
- Install one 150 MVAR switch shunt reactor at the existing East Garden City 345 kV substation
- Install one 50 MVAR switch shunt reactor at the existing Shore Road 138 kV substation
- Install three series reactors on the Ruland Road – New Bridge 138 kV circuits 1, 2 & 3 at the Ruland Road substation
- Install three series reactors on the East Garden City – New Bridge 138 kV circuits 1, 2 & 3 at the East Garden City substation
- Reinforce existing 903 PAR to 420 MVA at the Lake Success substation
- Reinforce the Jamaica-Lake Success 138 kV cable
- Install a circuit breaker between the Holbrook 138/69 kV transformers 2 & 2A and the Holbrook – Ruland Road 138 kV line (Line 138-882) at the existing Holbrook 138 kV substation
- Install a PASS breaker in place of breaker 1330 at the existing Barrett 138 kV substation
- Upgrade Central Islip-Hauppauge 138 kV line (Line 138-889)

- Modify relay systems to eliminate P5 contingencies at multiple substations, including Valley Stream 138 kV substation, East Garden City 138 kV substation, and Barrett 138 kV substation

Figure 12: T048 Propel Base Solution 2 Major Project Components (Refer to the description above for complete list of project components)

T049 Propel Base Solution 3

Propel Base Solution 3 proposal consists of the following components:

- Build a proposed Barrett 345 kV substation in a ring configuration with three 345/138 kV transformers in series with 138 kV 540 MVA PARs controlling flow towards Barrett and two 100 MVAR shunt reactors
- Build a proposed New Shore Road 345 kV station with one 345 kV 900 MVA PAR controlling flow towards the New Rochelle 345 kV station, one 345/138 kV transformer in series with a 138 kV 540 MVA PAR controlling flow towards the existing Shore Road 345/138 kV substation, and two 150 MVAR shunt reactors
- Build a proposed Ruland Road 345 kV substation in ring configuration connecting to existing Ruland Rd 138 kV substation with three 345/138 kV transformers, one 345 kV 650 MVA PAR controlling flow towards the East Garden City 345 kV substation, and two 150 MVAR shunt reactors
- Build a proposed New Rochelle 345 kV transition substation
- Build two proposed underground Barrett – East Garden City 345 kV AC lines
- Build a 345 kV tie line with a 900 MVA PAR from the East Garden City 345 kV substation interconnected to the existing Tremont 345 kV substation
- Build one proposed underground East Garden City – New Shore Road 345 kV AC line
- Build one proposed underground East Garden City – New Shore Road 138 kV AC line
- Build one proposed underground Ruland Road – Shore Road 345 kV AC line
- Build one proposed underground/submarine Shore Road – New Rochelle – Sprain Brook 345 kV AC line
- Convert and reconfigure the existing Ruland Road – New Bridge 138 kV circuit 3 and New Bridge – East Garden City 138 kV circuit 4 to a Ruland Road – East Garden City 345 kV line, bypassing the existing New Bridge 138 kV substation
- Install PASS breakers in place of breakers 1E and 6E at the existing Rainey 345 kV substation
- Modify the East Garden City 345 kV substation to a breaker-and-a-half configuration with a PAR-controlled connection of the existing Y-49 345 kV line (i.e., the two existing Y49 345/138 kV transformers will be used to connect the East Garden City 345 kV substation to the existing East Garden City 138 kV substation)
- Install one 100 MVAR switch shunt reactor at Sprain Brook 345 kV substation

- Install two series reactors on the Ruland Road – New Bridge 138 kV circuit 1 & circuit 2 at the Ruland Road substation
- Install two series reactors on East Garden City – New Bridge 138 kV circuit 1 & circuit 2 at the East Garden City substation
- Install a PASS breaker (i.e., two breakers in series) in place of breaker CB-1460 at the existing New Bridge 138 kV substation to address the stuck breaker fault
- Install a circuit breaker between the Holbrook 138/69 kV transformers 2 & 2A and the Holbrook-Ruland Road 138 kV line (Line 138-882) at the existing Holbrook 138 kV substation.
- Upgrade the Central Islip – Hauppauge 138 kV line (Line 138-889)
- Modify relay systems to eliminate P5 contingencies at multiple substations, including Valley Stream 138 kV substation, Lake Success 138 kV substation, East Garden City 138 kV substation, and Barrett 138 kV substation.

Figure 13: T049 Propel Base Solution 3 Major Project Components (Refer to the description above for complete list of project components)

T051 Propel Alternate Solution 5

Propel Alternate Solution 5 proposal consists of the following components:

- Build a proposed Barrett 345 kV substation with two 345/138 transformers in series with 138 kV 540 MVA PARs controlling flow towards proposed OSW Developer 138 kV Barrett substation, and one 100 MVAR shunt reactor
- Build a proposed New Shore Road 345 kV substation with a 345/138 kV transformer in series with a 138 kV PAR to connect to the existing Shore Road 345/138 kV substation, two 345 kV 900 MVA PARs controlling flow towards the New Rochelle 345 kV station, two 150 MVAR shunt reactors, and one 100 MVAR shunt reactor
- Build a proposed Ruland Road 345 kV substation in ring configuration with three 345/138 kV transformers connecting to the existing Ruland Road 138 kV substation, one 345 kV 650 MVA PAR controlling flow towards the East Garden City 345 kV substation, and two 150 MVAR shunt reactors
- Build a proposed New Rochelle 345 kV transition substation
- Build one proposed underground Barrett – East Garden City 345 kV AC line
- Build a 345 kV tie line with a 900 MVA PAR from the East Garden City 345 kV substation interconnected to the existing Tremont 345 kV substation
- Build a proposed underground East Garden City – New Shore Road 345 kV AC line
- Build a proposed underground Ruland Road – New Shore Road 345 kV AC line
- Build two proposed underground/submarine New Shore Road – New Rochelle – Sprain Brook 345 kV AC lines
- Build a 138 kV line with a 400 MVA PAR from the existing Syosset 138 kV substation to the Shore Road 345/138 kV substation
- Convert and reconfigure the existing Ruland Road – New Bridge 138 kV circuit 3 and New Bridge – East Garden City 138 kV circuit 4 to a proposed Ruland Road – East Garden City 345 kV line, bypassing the existing New Bridge 138 kV substation
- Install PASS breakers (i.e., two breakers in series) in place of breakers 1E and 6E at the existing Rainey 345 kV substation
- Modify the East Garden City 345 kV substation to a breaker-and-a-half configuration with a PAR-controlled connection of the existing Y-49 345 kV line (i.e., the two existing Y49 345/138 kV transformers will be used to connect the East Garden City 345 kV substation to the existing East Garden City 138 kV substation)
- Install two 100 MVAR switch shunt reactors at the Sprain Brook 345 kV substation

- Install series reactors on the following five existing 138 kV lines: Ruland Road – New Bridge circuit 1 & circuit 2, East Garden City – New Bridge circuit 1 & circuit 2, and East Garden City – Valley Stream circuit 1.
- Upgrade the 2.5-mile segment to each of the existing Syosset – Greenlawn 138 kV and the Syosset – Oakwood 138 kV lines.
- Install a second PAR at the existing 138 kV Northport substation.
- Install a PASS breaker (i.e., two breakers in series) in place of breaker CB-1460 at the existing New Bridge 138 kV substation to address the stuck breaker fault
- Install a circuit breaker between the Holbrook 138/69 kV transformers 2 & 2A and the Holbrook – Ruland Road 138 kV line (Line 138-882) at the existing Holbrook 138 kV substation
- Upgrade the Central Islip – Hauppauge 138 kV line (Line 138-889)
- Modify relay systems to eliminate P5 contingencies at multiple substations, including Valley Stream 138 kV substation, Lake Success 138 kV substation, East Garden City 138 kV substation, and Barrett 138 kV substation

Figure 14: T051 Propel Alternate Solution 5 Major Project Components (Refer to the description above for complete list of project components)

T052 Propel Alternate Solution 6

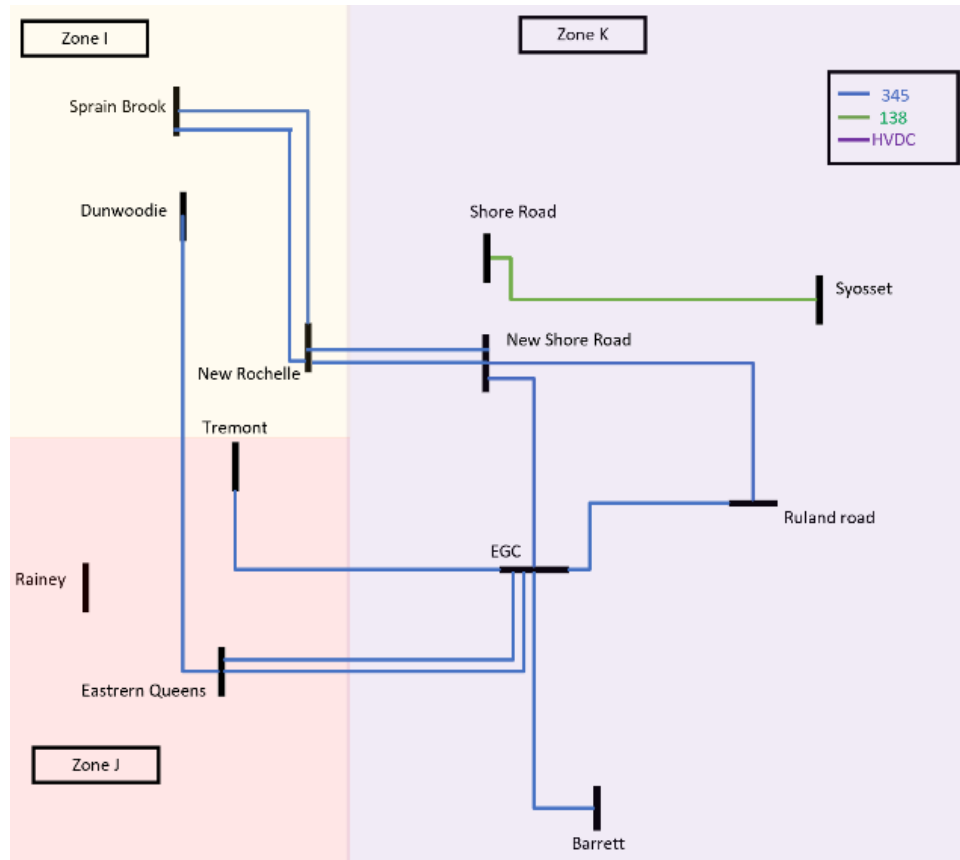

Propel Alternate Solution 6 proposal consists of the following components:

- Build a proposed Barrett 345 kV substation with two 345/138 kV transformers in series with 138 kV 540 MVA PARs controlling flow towards Barrett, and one 100 MVAR shunt reactor
- Build a proposed New Shore Road 345 kV substation with one 345/138 kV transformer in series with a 138 kV 540 MVA PAR controlling flow towards the Shore Road 345/138 kV substation, two 345 kV 900 MVA PARs controlling flow towards the New Rochelle 345 kV substation, two 75 MVAR shunt reactors, and 150 MVAR shunt reactor
- Build a proposed Ruland Road 345 kV substation in a ring configuration with three 345/138 kV transformers to connect to the existing Ruland Road 138 kV substation, one 345 kV 650 MVA PAR controlling flow towards the East Garden City 345 kV substation, and two 150 MVAR shunt reactor
- Build a proposed Eastern Queens 345/138 kV GIS substation in three-ring configurations by tapping the Valley Stream – Jamaica 138 kV line and Lake Success – Jamaica 138 kV line with three 345/138 kV transformers, three 138 kV PARs controlling the flow to the 138 kV transmission system, and one 345 kV 897 MVA PAR controlling flow towards the Dunwoodie 345 kV substation
- Build a proposed underground Barrett – East Garden City 345 kV AC line
- Build two proposed underground East Garden City – Eastern Queens 345 kV AC lines
- Build a proposed underground Eastern Queens – Dunwoodie 345 kV AC line
- Build a proposed underground East Garden City – New Shore Road 345 kV AC line
- Build a proposed underground Ruland Road – New Shore Road 345 kV AC line
- Build two proposed underground/submarine New Shore Road – New Rochelle – Sprain Brook 345 kV AC lines
- Build a Syosset – Shore Rd 138 kV line with one 138 kV PAR at the Syosset substation
- Covert and reconfigure the existing Ruland Road – New Bridge 138 kV circuit 3 and New Bridge – East Garden City 138 kV circuit 4 to a proposed Ruland Road – East Garden City 345 kV line, bypassing the existing New Bridge 138 kV substation
- Upgrade existing Lake Success – Jamaica 138 kV line and Valley Stream – Jamaica 138 kV line and loop them into the proposed Eastern Queens 138 kV substation
- Install PASS breakers (i.e., two breakers in series) in place of breaker 1E and 6E at the existing Rainey 345 kV substation
- Modify the East Garden City 345 kV substation to a breaker-and-a-half configuration with a PAR-controlled connection of the existing Y-49 345 kV line (i.e., the two existing Y49 345/138 kV

transformers will be used to connect the East Garden City 345 kV substation to the existing East Garden City 138 kV substation)

- Install one 120 MVAR shunt reactor and one 300 MVAR shunt reactor
- Install two 75 MVAR switch shunt reactors at the Sprain Brook 345 kV substation
- Install series reactors on the following four existing 138 kV lines: Ruland Road – New Bridge circuit 1 & circuit 2 and New Bride – East Garden City circuit 1 & circuit 2
- Install a PASS breaker (i.e., two breakers in series) in place of breaker CB-1460 at the existing New Bridge 138 kV substation to address the stuck breaker fault
- Install a circuit breaker between the Holbrook 138/69 kV transformers 2 & 2A and the Holbrook – Ruland Road 138 kV line (Line 138-882) at the existing Holbrook 138 kV substation
- Upgrade Central Islip – Hauppauge 138 kV line (Line 138-889)
- Modify relay systems to eliminate P5 contingencies at multiple substations, including Valley Stream 138 kV substation, East Garden City 138 kV substation, and Barrett 138 kV substation

Figure 15: T052 Propel Alternate Solution 6 Major Project Components (Refer to the description above for complete list of project components)

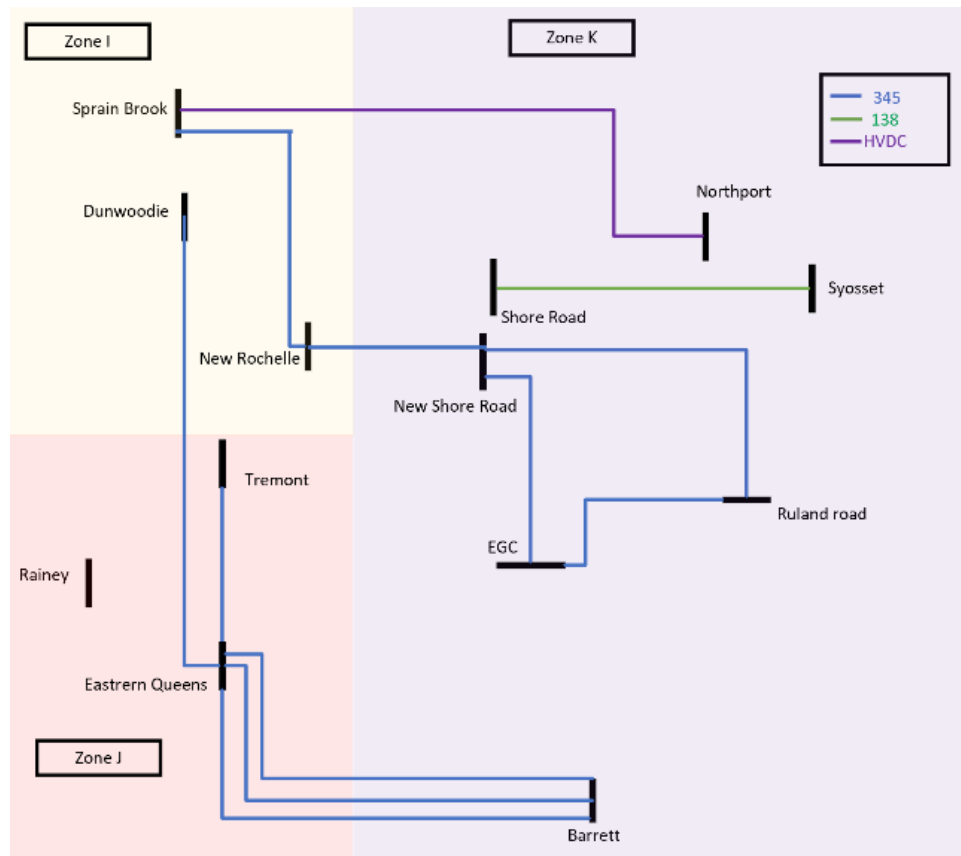

T053 Propel Alternate Solution 7

Propel Alternate Solution 7 proposal consists of the following components:

- Build a proposed Barrett 345 kV substation in a ring configuration connecting to the proposed 138 kV Barrett substation to accommodate offshore wind projects with three 345/138 kV transformers, one 345 kV 897 MVA PAR controlling flow towards the Eastern Queens 138 kV substation, and one 250 MVAR shunt reactor
- Build a proposed New Shore Road 345 kV substation with one 200 MVAR shunt reactor
- Build a proposed Ruland Road 345 kV substation in a ring configuration with three 345/138 kV transformers connecting to existing Ruland Rd 138 kV substation, one 345 kV 897 MVA PAR controlling flow towards the New Shore Road 345 kV substation, and one 200 MVAR shunt reactor
- Build a proposed New Rochelle 345 kV substation
- Build a proposed Eastern Queens 345 kV GIS substation in a three-ring configuration tapping Valley Stream – Jamaica 138 kV line and Lake Success – Jamaica 138 kV line, three 345/138 kV transformers and three 138 kV PARs controlling the flow to the 138 kV transmission system, and one 150 MVAR Shunt reactor
- Build a proposed Northport 345 kV substation in a ring configuration connecting to existing Northport 138 kV substation with ± 320 kV 1250 MVA HVDC converter station, four 345/138 kV transformers, one 200 MVAR shunt capacitor, and two 150 MVAR shunt capacitors
- Build a proposed Sprain Brook HVDC Converter Station connecting to existing Sprain Brook 345 kV substation
- Build three proposed underground Barrett – Eastern Queens 345 kV AC lines
- Build one proposed underground Eastern Queens – Tremont 345 kV AC line
- Build one proposed underground Eastern Queens – Dunwoodie 345 kV AC line
- Build one proposed underground/submarine Ruland Road – New Shore Road – New Rochelle-Sprain Brook 345 kV AC line
- Build one proposed underground Northport – Sprain Brook bi-direction ± 320 kV DC line rated at 1250 MVA
- Build a Syosset – Shore Rd 138 kV AC line with one 138 kV 517 MVA PAR at the Syosset substation
- Install a PASS breaker (i.e., two breakers in series) in place of breakers 1E at the existing Rainey 345 kV substation
- Loop-in the existing 901 & 903 lines into the proposed Eastern Queens 138 kV substations along with reinforcing the 903 cable and PAR.

- Update the existing 138 kV land cable between Valley Stream – Eastern Queens (replacing one section of 901) with one PAR at the Eastern Queens 138 kV substation
- Install one 200 MVAR shunt reactor at the Lake Success 138 kV substation
- Install one 50 MVAR switch shunt reactor at the Shore Road 138 kV substation
- Install one 150 MVAR switch shunt reactor at the Sprain Brook 345 kV substation
- Install three series reactors on the Ruland Road – New Bridge 138 kV circuits 1, 2 & 3 at the Ruland Road substation
- Install three series reactors on Eastern Garden City – New Bridge 138 kV circuits 1, 2 & 3 at the East Garden City substation
- Install a PASS breaker in place of breaker 1330 at the existing Barrett 138 kV substation
- Install a circuit breaker between the Holbrook 138/69 kV transformers 2 & 2A and the Holbrook – Ruland Road 138 kV line (Line 138-882) at the existing Holbrook 138 kV substation
- Upgrade the Central Islip – Hauppauge 138 kV line (Line 138-889)
- Modify relay systems to eliminate P5 contingencies at multiple substations, including Valley Stream 138 kV substation, East Garden City 138 kV substation, and Barrett 138 kV substation

Figure 16: T053 Propel Alternate Solution 7 Major Project Components (Refer to the description above for complete list of project components)

Appendix F: Facility Characterization List

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

June 10, 2022

Characterization of Project Facilities

This document provides the characterization of new transmission facilities and Public Policy Transmission Upgrades¹ comprising the Public Policy Transmission Projects proposed in response to the Long Island Offshore Wind Export Public Policy Transmission Need (“Long Island PPTN”), which is posted on the NYISO website in accordance with Section 31.4.6.5.1 of Attachment Y to the NYISO’s Open Access Transmission Tariff.

In accordance with the requirements of Section 31.4.6.5.1, the NYISO posted an initial list to provide stakeholders an opportunity to review and, as necessary, dispute facility characterizations prior to the start of the NYISO’s evaluation to identify the more efficient or cost-effective solution. The NYISO posted the initial list² on April 11, 2022, and four parties raised disputes³ on the characterization and/or ownership of several facilities. The NYISO considered the information and arguments raised in the written submissions, meetings with the parties, and at a meeting of the ESPWG on June 8, 2022, in updating and finalizing the facility characterizations. An asterisk (*) in the tables below denotes that a dispute was raised regarding the facility characterization and the dispute has not been resolved to satisfaction of a party at the time the NYISO posted the document.

Characterization of Transmission Line Facilities

ID	Transmission Facility ⁴	Facility Characterization	Owner of Existing Facility (if applicable)
L1	Barrett - Buchanan HVDC line	New	N/A
L2	Barrett (proposed) - East Garden City 345 kV line(s)	New	N/A
L3	Barrett (proposed) - Eastern Queens (proposed) 345 kV lines	New	N/A

¹ “Public Policy Transmission Upgrade” is defined in Section 31.1 of Attachment Y to the NYISO’s Open Access Transmission Tariff.

² New York Independent System Operator, Inc., “Initial Characterization of Project Facilities,” available at <https://www.nyiso.com/documents/20142/22968753/LIPPTN-FacilityCharacterization-InitialList.pdf>.

³ The written disputes and comments are available at <https://www.nyiso.com/documents/20142/22968753/Comments-on-Initial-Facility-Characterization.zip>.

⁴ For purpose of reviewing this list, “(proposed)” indicates that the terminal station is labeled as “proposed” in the substation list below.

ID	Transmission Facility ⁴	Facility Characterization	Owner of Existing Facility (if applicable)
L4	Barrett (proposed) - Tremont 345 kV line	New	N/A
L5	Buchanan (proposed) - Ramapo 345 kV line	New	N/A
L6	Central Islip - Hauppauge 138 kV uprate	Upgrade	LIPA
L7	East Garden City - Carle Place 138 kV line reconductor	Upgrade	LIPA
L8	East Garden City - Eastern Queens (proposed) 345 kV lines	New	N/A
L9	East Garden City - Jamaica 138 kV line	New	N/A
L10	East Garden City - Mott Haven 345 kV line	New	N/A
L11	East Garden City - Newbridge Road 345 kV line converting the existing 138 kV line	Upgrade	LIPA
L12	East Garden City – Roslyn 138 kV line reconductor	Upgrade	LIPA
L13	East Garden City - Shore Road (proposed) 345 kV line	New	N/A
L14	East Garden City - Shore Road 138 kV line	New	N/A
L15	East Garden City - Shore Road 345 kV line	New	N/A
L16	East Garden City - Tremont 345 kV line	New	N/A
L17	East Garden City (proposed) - Dunwoodie 345 kV line	New	N/A
L18	East Garden City (proposed) - Farragut 345 kV line	New	N/A
L19	East Garden City (proposed) - Newbridge Road 345 kV lines rebuilding the existing 138 kV lines	Upgrade	LIPA
L20	East Garden City (proposed) - Sprain Brook 345 kV line	New	N/A
L21	Eastern Queens (proposed) - Dunwoodie 345 kV line	New	N/A
L22	Eastern Queens (proposed) - Lake Success 138 kV line uprate	Upgrade	LIPA/ConEd ⁵
L23	Eastern Queens (proposed) - Tremont 345 kV line	New	N/A

⁵ This existing transmission facility is jointly owned, and the proposed upgrade will be assigned to the Transmission Owner that owns the portion to be upgraded.

ID	Transmission Facility ⁴	Facility Characterization	Owner of Existing Facility (if applicable)
L24	Eastern Queens (proposed) - Valley Stream 138 kV uprate	Upgrade	LIPA/ConEd ⁵
L25	Farragut - Sprain Brook 345 kV line	New	N/A
L26	Jamaica - Corona 138 kV line	New	N/A
L27	Lake Success - Jamaica 138 kV uprate	Upgrade	LIPA/ConEd ⁵
L28	Longshore (proposed) - Southgate (proposed) 345 kV lines	New	N/A
L29	Newbridge Road - Locust Grove 138 kV line reconductor	Upgrade	LIPA
L30	Newbridge Road - Ruland Road (proposed) 138 kV line reconductor	Upgrade	LIPA
L31	Newbridge Road - Ruland Road 138 kV lines reconductor	Upgrade	LIPA
L32	Northport (proposed) - Pilgrim 138 kV line	New	N/A
L33	Northport (proposed) - Sprain Brook HVDC line	New	N/A
L34	Northport (proposed)- Dunwoodie 345 kV line	New	N/A
L35	Offshore Platform - Buchanan HVDC line	New	N/A
L36	Pilgrim – Hauppauge 138 kV line reconductor	Upgrade	LIPA
L37	Pilgrim - Holbrook 138 kV line	New	N/A
L38	Ruland Road (proposed) - East Garden City 345 kV line converting the existing Ruland Road - New Bridge - East Garden City 138 kV lines	Upgrade	LIPA
L39	Ruland Road - Newbridge Road 345 kV line converting the existing 138 kV line	Upgrade	LIPA
L40	Ruland Road - Shore Road 138 kV line	New	N/A
L41	Ruland Road (proposed) - Shore Road (proposed) 345 kV line	New	N/A
L42	Ruland Road (proposed) - Sprain Brook 345 kV line	New	N/A
L43	Shore Road - Dunwoodie 345 kV line	New	N/A
L44	Shore Road - Sprain Brook 345 kV line	New	N/A
L45	Shore Road - Syosset 138 kV line	New	N/A

ID	Transmission Facility ⁴	Facility Characterization	Owner of Existing Facility (if applicable)
L46	Shore Road - Syosset 345 kV lines	New	N/A
L47	Shore Road (proposed) - Sprain Brook 345 kV line(s)	New	N/A
L48	Southgate (proposed) - Northgate (proposed) HVDC lines	New	N/A
L49	Sprain Brook - Mott Haven 345 kV line	New	N/A
L50	Syosset - Greenlawn 138 kV line uprate	Upgrade	LIPA
L51	Syosset - Oakwood 138 kV line uprate	Upgrade	LIPA
L52	Syosset - Ruland Road 345 kV line	New	N/A
L53*	Valley Stream (proposed) - East Garden City (proposed) 345 kV lines	New	N/A

Characterization of Substation Facilities

The following list describes and provides characterization of the substations and substation facilities from the proposed Public Policy Transmission Projects. The listing of facilities under a specific substation indicates that they are being installed within either; (i) the new footprint for the substation that is proposed but does not currently exist or (ii) the existing or expanded footprint for the existing substation that a project proposes to modify. Phase angle regulators (“PARs”), series reactors/capacitors, shunt reactors/capacitors, line terminal equipment, and transformers contained in the following list are proposed to be installed within the footprint of the identified substation (regardless of whether the footprint is new, existing, or expanded), unless specifically noted otherwise.

In reviewing the following list, please keep in mind that facilities may be proposed in one project as an installation in a new substation footprint, while similar facilities may be proposed in another project as an installation in an existing or expanded footprint of an existing substation. For example, a project may install a 345 kV ring bus in an expanded footprint of an existing substation, while another project could propose a 345 kV ring bus in a new substation footprint. As a result, it may appear on the list that facilities are being identified as both a new transmission facility and as a Public Policy Transmission Upgrade, but they are different proposed facilities from different projects.

ID	Sub ID	Substation Facility	Facility Characterization	Owner of Existing Facility (if applicable)
S1	Existing Barrett 138 kV Substation			
	B1	Breaker and a half GIS ⁶ installation	Upgrade	LIPA
	B2	Breaker installation	Upgrade	LIPA

Notes:

- In accordance with Section 31.4.6.5.1 of Attachment Y to the OATT, the descriptions of the facilities listed above are not expressly linked to any particular Public Policy Transmission Project for the Long Island PPTN, and may describe a facility proposed in one or more proposed Public Policy Transmission Projects. The descriptions are intended to provide enough detail in order for interested parties to reasonably understand the nature of proposed facilities and, as a result, may differ from a Developer's naming convention in its proposal(s).
- Stand-alone transition stations (*e.g.*, underground cable to overhead line junctions) and stand-alone HVDC converter stations are considered as a part of the line and not expressly listed, unless otherwise reflected in list of substation facilities.
- Certain facility elements are not separately broken out in the lists but are characterized as Public Policy Transmission Upgrades. Specifically, the following elements are characterized as Public Policy Transmission Upgrades, unless otherwise noted:
 - o re-terminating existing lines,
 - o decommissioning existing lines,⁸
 - o equipment to facilitate new connections to existing substations that is to be situated within the fence line of existing substations,
 - o upgrades to terminal equipment within existing substations to increase the rating of existing lines, and
 - o segments of lines that are proposed to be built in order to loop existing lines into and out of new substations.
- Line segments connecting new substations and nearby existing substations are characterized as new facilities, unless the connection utilizes an existing line (*e.g.*, re-terminating or looping into a new substation).

⁸ In the case of decommissioning an existing line, the work required to remove the existing line and associated equipment is considered a Public Policy Transmission Upgrade.

Appendix G: Scenarios

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

Appendix G: Scenarios

Description of Scenarios

For the purpose of the Long Island PPTN, the NYISO established three scenarios to evaluate the proposed solutions:

Baseline Scenario:

- 9,000 MW total of offshore wind generation – 6,000 MW in New York City and 3,000 MW in Long Island.
- Planned generation changes, such as known retirements and moderate buildout of upstate renewables and expected generation retirements consistent with *2021-2040 System & Resource Outlook* Contract Case and *2022 Reliability Needs Assessment* Base Case.
- Assumes generic transmission upgrades on the Barrett – Valley Stream 138 kV paths to fully alleviate congestion.

Policy Scenario:

- 12,000 MW total of offshore wind generation (6,000 MW in New York City and 6,000 MW in Long Island).
- Assumes upstate renewable buildout and fossil generation retirements and to meet CLCPA policy mandates consistent with *2021-2040 System & Resource Outlook* Policy Scenario 2 Case and *2022 Reliability Needs Assessment* 70x30 Case.
- Assumes generic transmission upgrades on the Barrett – Valley Stream 138 kV paths to fully alleviate congestion.
- CHPE and CPNY Tier 4 projects modeled in-service.

Policy + Barrett – Valley Stream Constraint Scenario (Policy + B-VS Scenario):

- Policy Scenario without the assumed generic transmission upgrades on the Barrett – Valley Stream 138 kV paths. In the first quarter of 2023, Empire Wind 2 accepted its cost allocation for System Upgrade Facilities but rejected its cost allocation for System Deliverability Upgrades in the Additional SDU Study for Class Year 2021. The System Upgrade Facilities were limited to providing the requested level of Energy Resource Interconnection Service for Empire Wind 2 and did not resolve the existing nearby transmission constraints on the Barrett – Valley Stream 138 kV paths.

In the above scenarios, modeling of offshore wind generators includes generators that currently have a NYSERDA or LIPA award, as well as reasonable assumptions for the remaining amount to achieve the 9,000 MW or 12,000 MW targets.

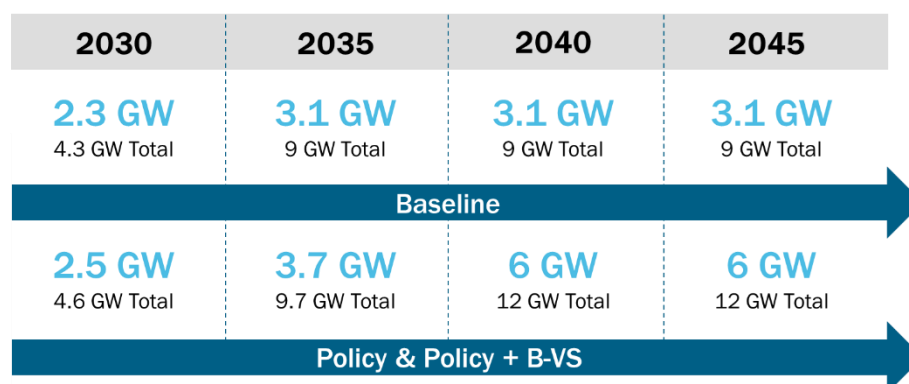

- 3,000 MW in Zone K was achieved by modeling the awarded 139 MW at East Hampton 69 kV,

880 MW at Holbrook 138 kV, 1,260 MW at Barrett 138 kV; and non-awarded 800 MW at Ruland Rd 138 kV.

- 6,000 MW in Zone K was achieved by modeling the awarded 139 MW at East Hampton 69 kV, 1,050 MW at Holbrook 138 kV, 1,350 MW at Barrett 138 kV; and non-awarded 1,150 MW at each of Ruland Rd 138 kV, East Garden City 345 kV, and Northport 138 kV.
- 6,000 MW in Zone J was achieved by modeling the awarded 816 MW at Gowanus 345 kV and 1,230 MW at Astoria 138 kV; and non-awarded 1,310 MW each at Farragut East 345 kV, Farragut West 345 kV, and West 49th St. 345 kV.

The timeline for offshore wind development in the production cost and capacity expansion models is described in Figure 1 below.

Figure 1: Long Island Offshore Wind Addition Timelines

The evaluation of the proposed solutions utilized tools, such as power flow, resource adequacy, production cost simulations, and capacity expansion.

Detailed Description of Models & Tools

Power Flow

Power flow analysis was used in evaluating metrics, such as transfer limit, expandability, and operability. The NYISO used the Baseline Scenario for the Viability & Sufficiency Assessment, as well as in the evaluation of the projects' impacts to system strength. The NYISO used the Policy and Policy + B-VS Scenarios in evaluating the projects' satisfaction of the transfer limit, expandability, and operability metrics. The Class Year 2021 Annual Transmission Baseline Assessment summer peak and spring light load cases were the starting point for power flow analyses and were updated with the following generation and tie line assumptions.

Figure 2: Power Flow Assumptions

	Viability & Sufficiency		Expandability		Transfer & Operability	Grid Strength
	Summer Peak	Light Load	Summer Peak	Light Load	Summer Peak	Light Load
Zone K OSW (MW)	3,000	3,000	6,000	6,000	6,000	3,000
Zone J OSW (MW)	6,000	6,000	6,000	6,000	0	0
Zone K Load (MW net)	4,423 (including 499 MW BTM solar)	1,107 (including 1,108 MW BTM solar)	4,423 (including 499 MW BTM solar)	1,107 (including 1,108 MW BTM solar)	4740	1,055 (including 1182 MW BTM Solar)
Zone K Conventional Generation Dispatch (Pgen MW)	~2,000	~500	~200	~200	~3100	~500
Zone K Conventional Reserve (Pmax - Pgen MW of committed units)	~900	~400	~1200	~1050	~1100	~400
LIPA Imports (MW into Long Island)	NNC = 0 CSC = 0 Neptune = 660 901/903 = -300	NNC = 0 CSC = 0 Neptune = 0 901/903 = -300	NNC = 0 CSC = 0 Neptune = 660 901/903 = -300	NNC = 0 CSC = 0 Neptune = 0 901/903 = -300	NNC = 0 CSC = 0 Neptune = 660 901/903 = -300	NNC = 0 CSC = 0 Neptune = 0 901/903 = -300

Additional details on the modeling assumptions and corresponding assessment are further described in the following appendices: Transfer & Operability in Appendix I, Expandability in Appendix J, and System Strength in Appendix K.

Resource Adequacy Models

The resource adequacy model used for the Long Island PPTN evaluation utilizes the MARS (Multi-Area Reliability Simulations) model from the *2022 Reliability Needs Assessment* (RNA) as the starting point to assess the proposed transmission projects. To establish a reference point for post-project NYCA LOLE impact comparison, the NYISO developed two pre-project models to represent the Baseline and Policy Scenarios for this analysis. Both models leveraged the MARS models developed under the *2022 Reliability Need Assessment* study process for study year 2030.

The following key changes were applied to the Long Island PPTN pre-project cases compared to the RNA's cases:

- The RNA Base Case for study year 2030 was further updated to reflect offshore wind targets and also to remove the proposed Champlain Hudson Power Express HVDC transmission project; and
- The RNA Policy Case Scenario 2 was further updated to reflect offshore wind targets. Both Champlain Hudson Power Express and the proposed Clean Path New York HVDC transmission projects continue to be modeled in this case.

These two models were further updated to reflect the impacts that each project would have on the

affected MARS topology transfer limits. Additional details on the model assumptions and corresponding capacity benefit assessment are further described in Appendix M.

Production Cost Simulations

The production cost model used for the Long Island PPTN evaluation utilizes the MAPS (Multi-Area Production Simulation) model from the *2021-2040 System & Resource Outlook* (Outlook) as the starting point for the three scenarios (Baseline, Policy, and Policy + B-VS). The Outlook study period is from 2021-2040, whereas the Long Island PPTN study period is from 2030-2050. The NYISO simulated discrete years at 5-year intervals to provide a reasonable representation of the twenty-year study period without simulating each year of production cost data.

Production cost savings for a project are calculated as the difference between the pre-project and post-project results over the duration of a project's study period, starting at the estimated in-service date and extending 20 years. The following key changes were applied to the Long Island PPTN pre-project cases compared to the Outlook's cases:

- Extended load forecast, fuel price forecast, and emission price forecast to 2045 to be modeled in production cost simulations. 2045 is considered as the proxy year to represent system conditions from 2045-2050; and
- Increased offshore wind capacity and points of interconnection for offshore wind generators in the three scenarios for the Long Island PPTN compared to the Outlook case assumptions.

Additional details on the production cost simulations are further described in Appendix L.

Capacity Expansion Simulations

The NYISO leveraged the capacity expansion model for Policy Case Scenario 2 from the Outlook in the Long Island PPTN evaluation. For purposes of the evaluation, the NYISO modified the capacity expansion model for Policy Case Scenario 2 to align the offshore wind generation buildout consistent with production cost simulations in this evaluation and modeled transmission upgrades accordingly for each proposed transmission project. This assessment was conducted for both the Policy and Policy + B-VS Scenarios for the top-tier projects for model years 2021-2040.

The following key changes were applied to the Long Island PPTN project cases compared to the Outlook's Policy Case Scenario 2:

- Increased offshore wind production due to reduced curtailment associated with each transmission project, as identified in the production cost simulations;
- Modeled changes in interzonal transfer limits for associated with each transmission project;

and

- Decreased the Zone K capacity reserve margin accordingly for each project based assumed increases in transmission security limits pursuant to the methodology described in Appendix N.

Additional details on the capacity expansion model and corresponding avoided cost assessment are further described in Appendix N.

Appendix H: Additional Information

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

Appendix H: Additional Information

The New York Public Service Commission (PSC) March 2021 Order Addressing Public Policy Requirements for Transmission Planning Purposes provided, *“The NYISO shall also consider other metrics in its evaluation of this Public Policy Requirement, including: changes in production costs; Load-Based Marginal Prices; transmission losses; emissions; Installed Capacity costs; Transmission Congestion Contract revenues; transmission congestion; impacts on transfer limits; and, resource deliverability.”* This appendix provides, for each of the metrics identified in the PSC Order, either a data figure or reference to other appendices where the supporting information can be found.

Production Cost Changes

Appendix L, Figure 3 contains the production cost savings for each of the Baseline, Policy, and Policy + Barrett-Valley Stream Scenarios.

Load-Based Marginal Prices

The figure below shows the estimated NYISO Location Based Marginal Prices (LBMPs) for each of the Baseline, Policy, and Policy + Barrett-Valley Stream Scenarios.

Case	NYISO Annual Average LBMP (\$/MWh)											
	Baseline				Policy				Policy + B-VS

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

Appendix I: Transfer Analysis

Transfer Limit Methodology

Transfer limit analysis calculated transfer limits with and without each project to determine the incremental impact on the amount of power that can be transferred across the LIPA Import and LIPA Export interfaces, while observing applicable reliability criteria. These transfer limits are “optimal transfers” where all generators may be dispatched anywhere between their maximum and minimum power output. These generators are dispatched independently (not proportionally) to facilitate transfers. The goal of this analysis is to mimic, to the extent possible, the energy market management system in the NYISO Control Center; however, it does not include generator bid information and instead assumes that all generators have identical bids.

Transfer limit analysis was performed under the following assumptions:

- 1) The transfer limits were evaluated using the generation summarized in Figure 1;
- 2) All NYISO Bulk Power Transmission Facilities (BPTF) lines, all 115 kV and above lines in Zones F–J, and all 138 kV and above line in Zone K were secured;
- 3) In accordance with NPCC criteria and NYSRC reliability rules, the contingency list was modified to include the project’s related contingencies;
- 4) Phase angle regulators were allowed to be at the optimized setpoints in pre-contingency conditions to facilitate transfers and their angle was fixed post-contingency;
- 5) Internal HVDC facilities were allowed to be optimally scheduled in pre-contingency conditions and this schedule was fixed post-contingency; and
- 6) The flows on all monitored lines are secured to their normal rating in pre-contingency conditions and the applicable emergency rating in post-contingency conditions.

Transfer limit analysis was based on the CY21 Annual Transmission Baseline Assessment transfer case with assumptions of Long Island offshore wind (OSW) consistent with the Policy Scenario.

Figure 1: Transfer Source and Sink Definitions

Interface	Source Zone (s)	Sink Zone (s)
LI-Export	K	ON – J
LI-Import	ON – J	K

Transfer Limit Results: Normal Transfer Limit Results

The normal all-lines-in-service transfer limits (N-1) of the LI Import and LI Export interfaces are presented in

Figure 2 respectively, for the pre-project system and for the system with each project.

Transfer Limit Results: Flexibility Under Outage Conditions

This analysis focused on transfer limits under the worst one single element and two single element maintenance conditions in order to evaluate the flexibility of each project given normal operations when all lines are not in service. When reviewing these transfer limits, larger import and export limits are preferable. Adding the import and export limits gives another useful indication of the operating range under outage conditions, which would give NYISO more operational flexibility.

The outage import and export transfer limits for the Policy Scenario are shown in Figures 6 and 7, respectively, and the range is shown in Figure 8. The same analysis was run for the top-tier projects on the Barrett-Valley Stream Scenario. Figures 9 and 10 show the import and export transfer limits, respectively, for the Barrett-Valley Stream Scenario and the range is shown in Figure 11.

Figure 12: Policy + Barrett-VS Scenario: Operability Ranges Visualized Under Maintenance Conditions

In order to explore each project's ability to accommodate net-load variability in Long Island, the NYISO performed a sensitivity analysis to assess the impact of an increase in transmission constraint margin. For the transmission constraint margin sensitivity, the operations flexibility range methodology uses the same assumptions as the Barrett-Valley Stream Scenario except it assumes that all Long Island/NYCA tie lines evenly split a 600 MW transmission constraint margin across all 345 kV AC lines from Zone K to the rest of the NYCA. The NYISO employed this sensitivity to further evaluate and distinguish among the top-tier projects. The outage import and export transfer limits for the transmission constraint margin sensitivity are shown in Figures 13 and 14, respectively. This analysis did not account for re-allocating the transmission constraint margin to account for the outage(s).

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

Appendix J: Expandability

Long Island Electrical Expandability Results

For purposes of the expandability metrics and given the New York's public policy objectives, the NYISO evaluated the electrical expandability based on the ability of each project to integrate more than the minimum 3,000 MW of offshore wind (OSW) energy injection into Long Island. The assessment performed N-0, N-1, and N-1-1 analysis for the Policy Scenario based on the assumption that up to 6,000 MW of offshore wind energy may be interconnected to Long Island. Figure 1 summarizes the maximum amount of Long Island offshore wind energy (up to 6,000 MW) that can be accommodated by each project without curtailment under N-0, N-1, and N-1-1 conditions.

Figure 1: Electrical Expandability (Base) Results

Electrical Expandability	Maximum Amount of Long Island OSW (MW)			
	Summer Peak		Spring Light Load	
	N0/N-1	N-1-1	N0/N-1	N-1-1

T047 - Propel Base 1	5,825	5,050	4,275	3,750
T048 - Propel Base 2	5,825	4,900	4,525	3,725
T049 - Propel Base 3	5,825	5,075	4,225	3,750
T051 - Propel Alt 5	6,000	5,075	5,125	4,300
T052 - Propel Alt 6	5,825	5,025	5,650	5,075
T053 - Propel Alt 7	6,000	5,375	5,300	4,350

The electrical expandability results presented in Figure 1 are based on the following assumptions:

- 1) The results were obtained using TARA's Security Constrained Dispatch function with DC power flow solution. Internal NYCA controllable lines (with exceptions mention in #3, below) and the offshore wind generators interconnected to Long Island were adjusted to prevent overloads.

¹ The flow across the 901/903 PARs exceeded the 300 MW setpoint. The OSW output would have to be curtailed to ~1,550 MW to maintain the PAR schedule and secure all monitored branches.

- 2) Long Island internal branches and tie lines of 138 kV and above were secured to their applicable ratings (normal for pre-contingency and LTE for post-contingency).
- 3) PAR schedules controlling flow on the Norwalk-Northport cables were allowed to adjust beyond their initial setpoint of 0 MW. The PAR schedule for the 901/903 lines connecting to Jamaica were held constant at 300 MW.

Because the future offshore wind buildout is unknown at this time, the NYISO further evaluated the expandability of the top-tier projects with a scenario that assumed reasonable changes in the modeling of offshore wind generation (such as injection locations and amounts). Figure 2 below presents these results for the spring light load Policy Scenario. The Figure 2 footnotes summarize project-specific offshore wind modeling adjustments that enabled a greater amount of offshore wind injection into Long Island.

Figure 2: Electrical Expandability Results for the Top-Tier Projects Under N-1 and N-1-1 Spring Light Load Conditions

Electrical Expandability - Top Tier	Maximum Amount of Long Island OSW (MW)	
	N-0/N-1	N-1-1

Long Island Physical Expandability Results

Under the expandability metric, the NYISO also evaluated each project’s physical expandability. Physical expandability evaluates the number of potential Points of Interconnection (POIs) proposed by a project. The potential POIs are broken down into those that are created by a project (Proposed POIs) and those that can be reasonably created in the future based on additional modifications to the transmission facilities (Expandable POIs). Proposed POIs are where the equipment necessary to make an open POI, e.g., breaker and buswork, are included in the project equipment list and costs. Expandable POIs are those points in a substation where the developer indicated that the project has incorporated space for the necessary POI equipment, but that equipment is not included in the project equipment list and costs. The evaluation does not consider whether project substations could be expanded further to accommodate additional POIs (e.g., addition of bays or conversion to a ring bus). Furthermore, breaker positions were not counted as POIs under certain situations:

- Breaker positions that become available by retiring a line,
- Potential for an OSW generator’s HVDC lead line to connect to a project’s HVDC converter station (i.e., turn into a multi-terminal HVDC system)
- Back-to-back breakers that were proposed to eliminate the potential for a stuck breaker contingency, and
- Equipment spacing concerns based on a preliminary review.

Figure 4 shows the Proposed POIs, and Figure 5 shows the Expandable POIs for each project at different substations.

Appendix K: System Strength

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

Appendix K: Operability & Resiliency – System Strength

System Strength

System Strength refers to system voltage and reactive strength performance. Short circuit ratio is a common screening method to obtain a high-level understanding of the system strength. In order to measure system strength with multiple inverter-based resources (IBRs) in close proximity to each other, the weighted short circuit ratio (WSCR) is calculated at critical points in the system. The WSCR is calculated with the formula below:

$$WSCR = \frac{\sum_i^n SCMVA_i \times P_{RMVAi}}{(\sum_i^n P_{RMVAi})^2}$$

Where $SCMVA_i$ is the short circuit capacity at bus i before the connection of IBR i and P_{RMVAi} is the MVA rating of IBR i to be connected. n is the number of IBRs and i is IBR.

Figure 1 shows the relative short circuit results at Barrett offshore wind Point of Interconnection (POI), Ruland Rd offshore wind POI, Holbrook offshore wind POI, and applicable HVDC POI(s) for the pre-project Baseline case and each post-project case. The WSCR was calculated under operating conditions with reduced synchronous generation using CY21 ATBA light load case for all-lines-in-service (N-0), and system outages loss of Y49 (N-1), outage of Y49 and Y50 (N-2), and loss of Y49, Y50, and a project tie line (N-3). The higher the WSCR number, the stronger the system is and generally the easier it is to integrate IBRs such as energy storage and offshore wind generation. The lower the WSCR number, the weaker the system is and there may additional system monitoring or studies required. NERC does not have a WSCR reliability criteria.

Appendix L: Production Cost & Performance

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

Appendix L: Production Cost Benefits

NYISO Production Cost Model

In analyzing the production cost metric, the NYISO utilizes production cost models developed in MAPS (Multi-Area Production Simulation) to analyze system congestion under various future scenarios and system conditions. The software performs a security-constrained economic commitment and dispatch and optimizes for the minimum hourly production cost of supply resources to meet the load plus losses.

The NYISO's production cost model optimizes 4-pool (NYISO, PJM, ISO-NE and IESO) generation to match the load in each hour with the aim of minimizing the overall system production cost.

Production cost models require input data to develop cost curves for the resources that the model will commit and dispatch to serve the load, subject to the constraints included in the model. Generator inputs to the model include generator heat rates, fuel price forecasts, emission price forecasts, and hourly generation profiles for renewable resources. Transmission inputs include an explicit nodal model and individual constraints, contingencies, and interface limitations. Peak and annual demand forecasts for each area/zone in each pool, as well as hourly load patterns, are the key inputs to formulate the load representation in the production cost model.

The NYISO's production cost simulations provide estimates of future system behavior based on the detailed inputs to the model. Results are available up to an hourly resolution and include metrics such as generation, load, LBMP, generator production cost, imports/exports, renewable generation curtailment, etc. System production cost is an industry recognized metric that can be used to measure the economic cost of meeting electricity demand with generation.

Project Evaluation Using Production Cost Models

Production cost simulations can be utilized to gauge the effectiveness of a proposed transmission project in reducing NYCA wide production cost. A pre-project case is first simulated without a project in place to establish a baseline for comparison with all of the assumptions included for the model. A post-project case with the transmission project added to the underlying transmission model is then simulated and metrics are compared to the pre-project case. Production cost savings for a project is calculated as the difference between the pre-project and post-project results over the duration of a project's study period, starting at the estimated in-service date and extending 20 years.

NYCA production cost is the total generation cost of producing power to serve NYCA load. The total cost includes the following components:

1. Fuel cost (fuel consumption mmBtu multiplied by fuel cost \$/mmBtu);
2. Variable operations and maintenance (O&M) cost (VOM adder \$/MWh);
3. Emission cost (emission allowance price multiplied by total allowance);
4. Start-up cost (number of starts multiplied by start-up cost); and
5. NYCA Imports and Exports evaluated at the solution case proxy bus LBMP values.

$$\text{NYCA wide Production Cost} = \sum_{n=1}^{8760} \{ \text{NYCA Generator Costs}_n + \text{Import Costs}_n - \text{Export Costs}_n \}$$

Generation resources with no variable cost (*e.g.*, solar, wind, and hydro) do not contribute to production cost given that they produce energy for \$0/MWh. Any Renewable Energy Credit (REC) subsidies for each of these resource types are modeled as a negative “bid adder” and are solely used to create a dispatch order and do not contribute to production cost.

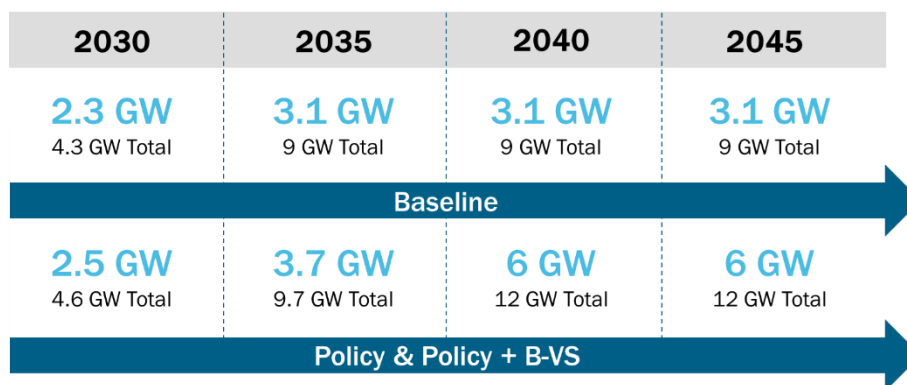

Assumptions for Production Cost Analysis

The production cost model used for the Long Island Offshore Wind Export Public Policy Transmission Need (Long Island PPTN) evaluation utilizes the *2021-2040 System and Resource Outlook* (Outlook) Contract Case as the starting point for the “Baseline” Scenario. The “Policy” Scenario for the Long Island PPTN evaluation is largely derived from the Outlook Policy S2 Case. The “Policy + Barrett-Valley Stream (B-VS)” Scenario is the Policy Scenario with the inclusion of the Barrett-Valley Stream constraint. The Outlook study period is from 2021 to 2040, whereas the Long Island PPTN study period is from 2030-2050. The NYISO simulated discrete years at 5-year intervals to provide a reasonable representation of the twenty-year study period without simulating each year of production cost data.

The following key changes were applied to the Long Island PPTN pre-project cases compared to the Outlook's Contract and Policy S2 cases:

- Extended load forecast, fuel price forecast, and emission price forecast to 2045 to be modeled in production cost simulations. 2045 is considered as the proxy year to represent system conditions from 2045-2050.
- Increased offshore wind capacity and points of interconnection in both the Baseline and Policy Scenarios for the Long Island PPTN compared to the Outlook Contract and Policy S2 cases. The following figure shows the increased capacity and timeline of offshore wind resource installation.

Figure 1: Timeline of Offshore Wind Installation in Production Cost Analyses

- Lower kV constraints (less than 115 kV) are relaxed in Long Island for the Baseline Scenario.
- Constraints lower than 69 kV are relaxed in New York City and Long Island for the Policy Scenario. For all other zones in the Policy Scenario, all constraints lower than 230 kV are relaxed beyond 2040.
- Barrett – Valley Stream, Valley Stream – East Garden City (secure for the reverse direction from East Garden City – Valley Stream), Barrett – Freeport, and Freeport – Newbridge 138 kV lines are relaxed for the Policy Scenario (However, the Policy + B-VS Scenario removes this assumption).

Pre-Project Case Results

The pre-project cases were run for the Long Island PPTN Baseline Scenario, the Long Island PPTN Policy Scenario, and the Long Island PPTN Policy + B-VS Scenario. The pre-project case results provide a reference set of data points which can be compared against the results produced after the project is put in-service. The pre-project cases show that there is significant curtailment, especially in the Policy and Policy + B-VS Scenarios, of offshore wind resources in Long Island. Curtailment of low-cost resources, such as offshore wind, can be caused by constraints either local or on the bulk level. This curtailment can cause other higher cost resources to be dispatched to serve load either on Long Island or in the neighboring regions.

Figure 2: Pre-Project Production Cost Results

Long Island has five tie interfaces, including connections to Dunwoodie (Y49 and Y50), PJM (Neptune), NY City (Jamaica-Corona), Cross Sound Cable, and Northport Norwalk (ISONE). Two of the interfaces (Neptune and Cross Sound Cable) are only scheduled to import energy into Long Island. The limited export capability from Long Island in the pre-project cases limits the amount of low-cost energy produced by offshore wind resources to serve load outside of Long Island in periods when the output from these resources is high. The Dunwoodie-Long Island interface is consistently one of the most congested interfaces in the NYCA. The two tie-lines (Y49 and Y50) transfer power from the lower Hudson Valley to Long Island. The flow is higher in the Baseline Scenario compared to the Policy Scenarios due to the difference in the assumed offshore wind injections in Long Island. The Policy Scenarios have higher offshore wind injections in Long Island that push back on the imports from this interface.

The Long Island PPTN post-project cases all improve the export capability of Long Island by adding tie-lines between Long Island and the lower Hudson Valley. This added transfer capacity/headroom and upgrades to the internal Long Island system reduces the amount of curtailment from offshore wind resources that can be used to offset more expensive generation in New York or Imports from neighboring regions.

Post-Project Results

Production cost savings for each project is calculated by taking the difference between the pre- and post-project NYCA-wide production costs. Production cost savings are achieved when transmission projects unbottle cheaper resources in the system that replace more expensive generation, resulting in the reduction of the overall cost of serving load. Transmission projects provide additional electrical pathways that may be used by generators to serve load and, therefore, can decrease transmission congestion.

Production cost savings are also achieved by offsetting higher cost energy imports from neighboring regions with lower cost internal generation previously inaccessible due to transmission congestion. In general, all of the proposed projects to address the Long Island PPTN produce savings by unbottling offshore wind resources in Long Island and reducing the amount of imports from neighboring regions. The figures below show the estimated production cost savings for each project over a 20-year period in 2022 real million dollars.¹

¹ To calculate the net present value of future production cost savings, each 5-year savings calculation (e.g., 2025, 2030, 2040, and 2045) was assumed to persist for the following 4 years. The full 20-year stream of savings was then discounted to the 2022 year using a 7.05% discount rate.

Performance Evaluation

The performance evaluation leverages the same models and simulations from the production cost analysis but evaluates several metrics related to the performance of the system. The transmission utilization, energy deliverability, and CO₂ emissions assessments help to quantify the impacts that projects may have on the NYCA.

Transmission Utilization

The performance of a project is evaluated based on its ability to efficiently utilize the transmission network to increase energy transfers between Long Island and the rest of NYCA. The transmission utilization metric is the total annual energy transferred (MWh) over an interface. The results help determine the effectiveness of a transmission project to export offshore wind energy off Long Island and to import energy when needed.

For the purposes of this analysis, transmission utilization is measured as the total annual energy transacted across existing and proposed project inter-zonal transmission paths that interconnect to the Long Island (Zone K). This also includes transmission paths that connect to other areas within the NYCA and external to the NYCA.

Flows across the tie-lines from Long Island to the rest of NYCA and neighboring regions are divided into import and export energy, which are netted on an hourly basis and summed over each year. The 20-year flow estimates are calculated assuming equal flows over the 5-year period in between the simulation years.

T053 - Propel Alt 7	134,975	145,721	149,130	43,409	77,148	59,591

Energy Deliverability

The performance analysis also considers the energy deliverability impact of proposed projects on projected offshore wind resources. Energy deliverability represents the ability of renewable generation (e.g., wind, solar, and hydro) to inject energy into the grid to serve end-use consumers without curtailment. It is expressed as the ratio of energy generated to total potential energy for those resources. Generally, energy deliverability is reduced as more renewable capacity is added to the system due to the transmission constraints in the system. The greater the renewable generation curtailment in a specific location, the greater the opportunity for transmission investment.

$$\text{Energy Deliverability (\%)} = \frac{\text{Annual Energy Production (GWh)}}{\text{Potential Annual Energy Production (GWh)}}$$

$$\text{Energy Deliverability (\%)} = 100\% - \text{Curtailment (\%)}$$

Constraints in the existing system and new constraints that may be binding in a scenario with high penetration of offshore wind limit the amount of renewable energy that can be utilized to serve load. To enable effective use of these resources, proposed projects need to address congestion at the local and bulk transmission levels to increase energy deliverability. Projects that enable high energy deliverability (and thus lower curtailments) displace more costly generation dispatch in the system or imports from

neighboring regions. This is reflected in the total production cost savings achieved by the project.

Additional Production Cost Results

NYCA Import/Export

The NYCA-wide production cost savings are also impacted by changes in the Import and Export flows on the NYCA ties with neighboring regions. Therefore, an overall reduction in net Imports (Imports – Exports) amounts due to the addition of a project results to higher production cost savings. Reduction in net Imports also represents higher utilization of in-state resources (e.g., offshore wind) that displaces Imports from neighboring regions to serve load. The following figures show the Import, Export, and net Import flows to all four neighboring regions for New York. Projects with larger reductions in net Imports correspond to higher production cost savings.

Long Island Net-Load Variability Sensitivity

As offshore wind generation projects are interconnected to Long Island, the need to maintain flexible resources to balance minute-to-minute energy variability in the area will increase. Variability can come from several sources such as real-time changes in electrical demand and output of both behind-the-meter and utility-scale solar photovoltaic resources connected to the Long Island system. In today's system, any unforeseen generation resource availability in Long Island is accommodated through a combination of reserves and a transmission constraint margin. Long Island does not currently have a specific regulation or spinning reserve requirement but shares a multi-zonal requirement with other NYISO zones.

To calculate transmission security margins for use in this sensitivity, the NYISO performed a statistical analysis using the hourly offshore wind, solar, and load patterns from the production cost models. Assuming a normal distribution, the statistical probability of exceedance values of hour-to-hour changes in net load (load minus solar minus wind), which are used to set the Long Island transmission constraint margin, are shown in the figure below.

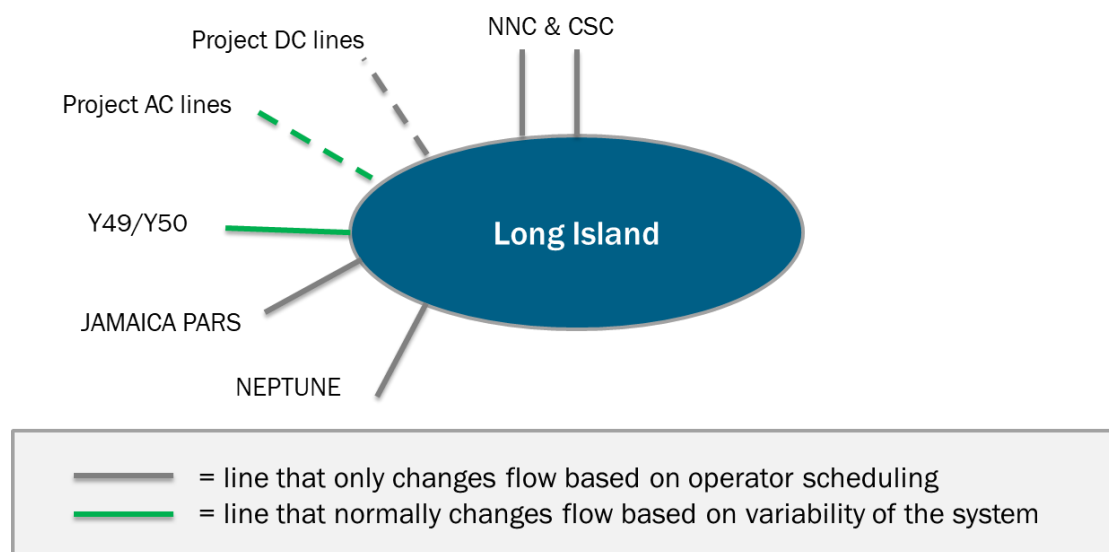

Figure 29: Long Island Constraint Reliability Margin Calculation Results

Year	LI Reliability Margin (MW)		
	P90	P95	P99
2030	314	407	614
2035	417	544	788
2040	623	815	1,228
2045	664	864	1,289

To estimate the impact of the reliability margin on the proposed projects, the P95 value was modeled in the Policy + B-VS Scenario in both the pre-project case and for each of the top-tier projects. It is important to note that production cost simulations are performed with "all lines in-service" and do not capture pre-contingency outages. If a transmission outage on a Long Island tie line were to be modeled pre-contingency, both offshore wind curtailment and project production cost savings would increase.

The margin value was divided by the number of transmission ties between Long Island and other areas that can support variability. This value is then subtracted from the thermal limit of each line. In the pre-project case, there are only two tie-lines that can support variability in Long Island, which are the Y49 and Y50 transmission lines. Proposed projects add between zero and three new tie lines that can support variable flows. The diagram below conceptually shows current and proposed tie lines.

Figure 30: Long Island Tie-Line Diagram

Results from the Policy + B-VS Scenario production cost simulations modeling the P95 reliability margins are shown in the figures below.

Appendix M: Capacity Benefits LOLE Reduction

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

Appendix M: Capacity Benefits LOLE Reduction

Overview of Methodology

The capacity benefit metric evaluates the incremental capacity benefits created by each proposed project. The methodology compares the pre- and post-project system resource adequacy to identify the reduction in the NYCA loss of load expectation (LOLE).¹ A greater reduction in the NYCA LOLE, compared to the pre-project case, indicates greater capacity benefits created by a proposed project.

The methodology is comprised of three major steps, as illustrated in Figure 1. The first step evaluates and resets the NYCA LOLE of the pre-project Reliability Needs Assessment (RNA) base and policy cases (MARS cases) to criteria (i.e., 0.1 event-days per year) using NYISO's LCR Optimizer. The second step models transmission changes specific to a project by adding new interzonal pipes and updating the Emergency Transfer Criteria (ETC) limits of the associated interfaces. MARS is then run on the modified RNA cases with the project to evaluate the change in NYCA LOLE. The third and final step involves calculating the annual capacity benefit of a project by applying a cost of reliability improvement (CRI) (\$/0.001 LOLE) to the change in NYCA LOLE brought by each project.

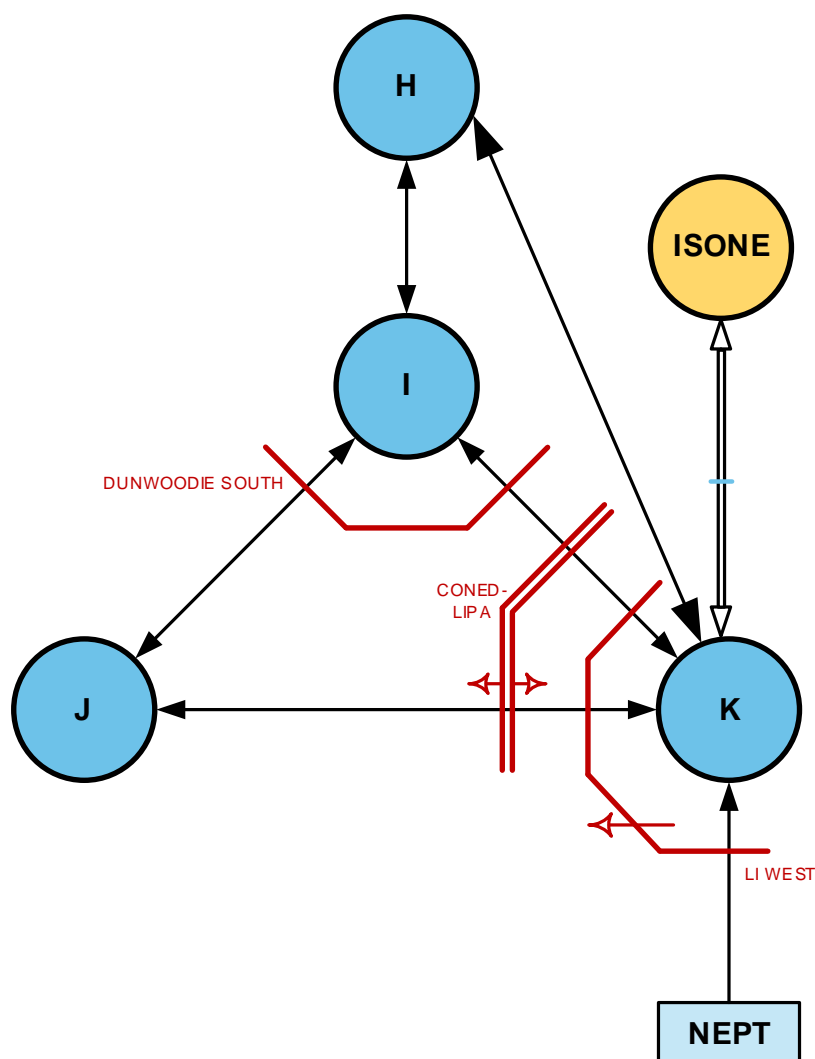

Figure 1: Capacity Benefits Evaluation Process

¹ The New York State bulk power system is planned to meet a LOLE that, at any given point in time, is less than or equal to an involuntary firm load disconnection that is not more frequent than once in every 10 years, or 0.1 events per year.

Thermal transfer limit analysis was performed using PowerGEM TARA, based on DC (linear) power flow, which assumes that voltages, reactive flows, or losses do not change with increased transfer levels. Emergency transfer limits of affected MARS topology interfaces were calculated with and without each project to determine the incremental impact transfer limits due to the addition of each project, as shown in the Figure 2.

Figure 2: Affected MARS Topology Interfaces

In accordance with NPCC criteria and NYSRC reliability rules, the contingency list was modified to include each project's related contingencies. Phase angle regulators maintained scheduled power flow in pre-contingency conditions but were fixed at their pre-contingency angle in post-contingency conditions. HVDC facilities maintained scheduled power flow in pre-contingency conditions but were fixed post-contingency conditions.

An emergency interface transfer limit is the transfer level where a) a branch flow reaches its normal rating under pre-contingency conditions or b) a branch flow reaches its short-term emergency (STE) rating following a single-line, multi-element, or generator outage. Affected MARS topology transfer limits for Export and Import are shown in Figure 3 and Figure 4, respectively.

Capacity benefits can be theoretically evaluated by comparing the capacity procurement requirement

in the downstate area before and after each of the proposed solutions to the Long Island Offshore Wind Export Public Policy Transmission Need are in service. Currently, the NYISO determines the capacity procurement requirements for the downstate area through the Locational Capacity Requirements (LCR) process. The methodology and assumptions used in the LCR process via the LCR Optimizer are based on current system and market configurations, as well as near-term economic conditions. They include, but are not limited to, the limitations on the NYCA topology and Net Cost of New Entry (CONE) for new technologies. Based on the NYISO's past experience, the outcomes from the LCR Optimizer are sensitive to small changes in any of these assumptions.

In developing the methodology for calculating the capacity benefits based on LOLE reduction, the NYISO staff considered but decided against using the LCR process directly to evaluate capacity benefits of proposed solutions to the Long Island PPTN. First, the assumptions used in the LCR Optimizer, as discussed above, are expected to go through significant changes in the next decade. The NYISO is also planning to explore enhancements to the LCR Optimizer in 2023. Assessment with the current LCR Optimizer might introduce unnecessary volatility in the evaluation outcomes. Second, applying the LCR Optimizer directly to evaluate each project would require significant efforts and computing time to develop and test different combinations of future system, economic and market assumptions. Based on the foregoing, the NYISO focused on methodologies other than the LCR process to directly evaluate capacity benefits for the purpose of its comparative evaluation.

However, the current LCR Optimizer provides a methodology in bringing a MARS database to meet the 0.1 event-days/year LOLE criterion. This will be discussed further in the following section.

LOLE Calculation Assumptions and Results

Pre-Project

To establish a reference point for post-project NYCA LOLE impact comparison, the NYISO developed two pre-project models—both based on the MARS models developed under the 2022 Reliability Need Assessment² study process for study year 2030:

1. The 2022 Reliability Need Assessment (RNA) Base Case for study year 2030 was further updated to reflect offshore wind targets (Figure 5) and also to remove the proposed Champlain Hudson Power Express (CHPE) HVDC transmission project (Figure 6).
2. The 2022 Reliability Need Assessment (RNA) Policy Case Scenario 2 was further updated to

² Additional RNA details are available at the links below:

2022 RNA Report: <https://www.nyiso.com/documents/20142/2248793/2022-RNA-Report.pdf>

2022 RNA Appendices: <https://www.nyiso.com/documents/20142/34651464/2022-RNA-Appendices.pdf>

reflect offshore wind targets (Figure 5). Both CHPE and the proposed Clean Path New York (CPNY) HVDC transmission projects continue to be modeled in this case (Figure 6).

Figure 5: Offshore Wind Capacity Assumptions (MW)

	Baseline	Policy Case
Zone K Total	2,279	2,539
Zone J Total	2,046	2,046

Figure 6: Tier 4 Proposed HVDC Project Assumptions

Tier 4 Projects	Baseline	Policy Case
CHPE	Remove	Retain
CPNY	Not modeled	Retain

Each of the two models were developed to reflect the expected system conditions of a specific planning study year and scenario and have much lower LOLE than the 0.1 event-days/year LOLE criterion. In order to have visible LOLE improvements to facilitate the evaluation, the NYISO applied the current LCR Optimizer and inputs used in the 2021 LCR study, adjusting these two models to meet the LOLE criterion of 0.1 event-days/year. With the adjustments, each of these two models became the reference point for the post-project NYCA LOLE impact. Better performance under this metric is represented by greater decreases in LOLE from 0.1 event-days/year reference, as lower NYCA LOLE means a more reliable system from resource adequacy perspective.

Post-Project

Starting from the two pre-project MARS models at-criterion described above, two models were developed for each of the projects, by reflecting their impacts on the affected MARS topology transfer limits, and as shown in the Figure 3 and Figure 4 above.

The NYCA LOLE results are summarized in Figure 7 below.

Cost of Reliability Improvement

The monetary value of capacity benefits is measured by how each project affects LOLE and the Cost of Reliability Improvement (CRI). CRI represents the compensation that a generator would receive in the capacity market for providing comparable LOLE benefits. Based on the Net CONE values of the current capacity demand curves and the estimated reliability benefit from additional capacity, it is estimated that a generator would receive \$2.5 million per 0.001 change in LOLE per year. In the figure below, the Delta LOLE results of each project are multiplied by the \$2.5M CRI value to provide an annual capacity benefit of each project.

Appendix N: Avoided Cost Assessment

Long Island Offshore Wind Export Public Policy Transmission Planning Report

**A Report from the New York
Independent System Operator**

June 13, 2023

Appendix N: Avoided Cost Assessment

Overview of Methodology

All of the proposed Long Island PPTN transmission projects increase import and export capability of Long Island that facilitate better utilization of electric supply to meet demand across NYCA. This reduces the expected capacity of new emission-free generation projects needed to meet State policy. To measure the economic impact of this phenomenon, the NYISO has implemented a new assessment in the capacity benefit metric calculations. The avoided capital cost assessment measures the reduction in the capital cost of emission-free generation required to build future resources through 2040. This assessment reflects the benefits from the additional transmission expansion to, among other things, potentially reduce the necessary Renewable Energy Contracts (RECs) procurement by NYSERDA to meet the state energy policy and subsequently decrease the overall cost to New York ratepayers.

The NYISO leveraged a capacity expansion model that is designed to optimize future system buildout while adhering to demand and policy requirements. This analysis was conducted for both the Policy and Policy + B-VS Scenarios for a set of projects that necessitated additional evaluation to distinguish their economic benefits to the transmission system.

Methodology

- Update transfer limits associated with each transmission project
- Offshore wind energy profiles, which are consistent with outputs from production cost simulations, model the “un-curtailed” offshore wind energy associated with the addition of each transmission project
- Increased transfer capability of each transmission project is translated to a reduction in the Zone K capacity reserve requirement
- Perform capacity expansion simulations for both pre- and post-project cases

Evaluation

- Measure the change in generation buildout costs driven by a transmission project’s ability to (1) reduce offshore wind energy curtailment and (2) increase transfer capability to/from Long Island

The results from this assessment can be combined with the production cost metric to develop a holistic comparison of proposed transmission projects economic benefits.

Detailed Assumptions

The proposed transmission projects are represented in the capacity expansion model through: 1) an increase in offshore wind production due to reduced curtailment identified in the production cost models,

2) interzonal transfer limit changes, and 3) Zone K capacity reserve margin decreases driven by increase in transmission security limits. Consistent with production cost simulations, the NYISO used model year 2030 as the estimated in-service date for the proposed transmission projects.

Modeling Offshore Wind Curtailment Reduction in Avoided Cost Assessment

As identified in the **Production Cost** and **Performance** metrics, all proposed projects are effective at reducing offshore wind curtailment levels and unbottling offshore wind resources interconnected to Long Island. To model the impact that the proposed projects have on offshore wind generation, the offshore wind energy outputs from the production cost simulations were used as inputs to the capacity expansion model for the avoided cost assessment starting at the estimated in-service date. Hourly outputs from each offshore wind plant were extracted for both the pre- and post-project cases from the production cost simulations and provided as fixed profiles for the capacity expansion model. Since production cost simulations were run at 5-year intervals (2030, 2035, 2040, and 2045), offshore wind outputs were assumed constant for the in between years for the capacity expansion simulations. For instance, the offshore wind profiles for 2035 were assumed in the capacity expansion model for years 2035-2039. As compared to the pre-project case, each proposed transmission project assumes a higher energy contribution from offshore wind generators due to the reduction in curtailment levels from the production cost simulations.

The figure below summarizes the annual Long Island offshore wind curtailed energy for both the pre-project and post-project scenarios for a set of projects that necessitated additional evaluation to distinguish their economic benefits to the transmission system. Both the Policy and Policy + B-VS Scenarios were evaluated with the Policy + B-VS Scenario having higher offshore wind energy curtailment due to the inclusion of the Barrett – Valley Stream transmission constraints.

Modeling Interzonal Transfer Limits

For each analyzed project, new connections between zones are modeled as new “pipes” in the pipe-and-bubble capacity expansion model. Consequently, the Long Island export interface limit was also upgraded after conducting linear N-1 thermal transfer limit analysis, which accounted for the new pipes between zones.

Figure 2: Long Island “Pipe” Limits Under N-1 Conditions (MW)

Calculation of LCRs for Avoided Cost Assessment

The purpose of considering capacity reserve margin changes for Zone K in the avoided cost analysis is to estimate potential benefits from improved import capabilities into Zone K. In NYISO’s Locational Minimum Installed Capacity Requirements (LCR) determination process, Transmission Security Limit Floors (TSL Floors), representing the low bound for LCRs, are implemented for all Localities. For purposes of the avoided costs analysis, the NYISO leveraged the methodology of the TSL Floors to approximate the reduction in the Zone K LCR for each of the projects analyzed due to increased import capability. The TSL Floor methodology used for the LCR process would produce the TSL Floors in the ICAP terms. However, since the Avoided Cost Assessment models LCRs in terms of UCAP requirement, the TSL Floor methodology is modified in this assessment to produce the UCAP requirement floors. The Bulk Power Transmission Limit for Long Island as part of this modified TSL Floor calculation was assumed to increase by the incremental import capability for each proposed project under the most limiting N-1-1 contingency conditions as compared to the pre-project case.

The LCRs utilized in NYISO markets are presently determined by the LCR optimizer, based on assumptions and inputs that reflect future system and market conditions. As noted in the **Capacity Benefits** metric, the LCR results are very sensitive to these assumptions and making these assumptions for the 20-year study timeframe would be speculative. Additionally, the actual Zone K LCR can be

impacted by the LCRs of the other Localities. Therefore, for the purpose of the avoided cost analysis in this comparative evaluation, the NYISO considers that it is reasonable to assume that changes in the Zone K LCRs are based on the changes in the modified TSL Floor for Zone K. Figures 3 and 4 show the inputs used in calculating the Zone K LCRs in the avoided costs analysis for purposes of this evaluation. Figure 5 shows the modified TSL Floors calculation used to determine changes in the Zone K LCR assumed in this evaluation for model year 2030. This modified TSL Floor calculation methodology is consistent with the one used for the LCRs for the 2023-2024 Capability Year.

Simulation Results

With the proper representation of each transmission project in place, the capacity expansion model simulation was performed up to 2040, and results were compiled. The analysis identified a few common trends that describe the impact of the evaluated transmission projects' impact on future generation buildout to meet system needs.

- All projects reduce the amount of upstate solar capacity needed due to the reduction in Long Island offshore wind energy curtailment. The increased energy associated with reduced curtailment allowed energy demand and renewable policy targets to be met with less renewable generation projects.
- All projects improved the transmission connections between Upstate and Downstate New York areas and increased the power transfer capability between the regions. With increased transmission limits to Long Island, the Zone K capacity reserve margin requirement is reduced and the capacity needed to meet statewide reliability requirements can then be relocated to more cost-effective geographic areas.

Each evaluated transmission project provided different magnitudes of benefits but were generally produced by the same system impacts as described. The analysis revealed that the specific designs of the transmission project affect how much savings can be achieved.

Offshore Wind Curtailment Reduction Impacts

As each proposed transmission project increases the electrical connectivity between Long Island and other areas in New York, more offshore wind energy can be injected into the NYCA. Increased offshore wind energy production due to the addition of a transmission project displaced the need for as much solar generation capacity and its production in several upstate zones as compared to the pre-project case. The figures below highlight the reduction in solar capacity due to the addition of each project evaluated in the Policy and Policy + B-VS Scenarios.

Several of the proposed projects reduce annual offshore wind curtailment in 2040 by over 3 TWh. Assuming a 40% annual capacity factor for offshore wind and 20% for solar, this equates to approximately a 1,700 MW equivalent reduction in solar capacity. The charts above show results from the fully optimized capacity expansion model where the proposed projects displace between 0.9 – 2.7 GW UPV capacity NYCA wide by 2040. Generally, the results from the model align with the simple calculation provided given the reduced curtailment provided by each project. For each project, the majority of solar capacity displaced is in Zones A, D, and E.

Long Island Import Capability Increase Impact

Complementary to the reduction of curtailment benefits, the increased import transfer limits from the proposed projects also increase the free exchange of energy to Long Island from other NYCA zones. This allows for a reduction in the amount of generation capacity needed to be geographically located on Long Island to meet reliability requirements. As a result, emission-free generation capacity (e.g., Dispatchable Emission Free Resources) can be more cost-effectively constructed in New York areas outside of Long Island, and this produces a capital cost savings.

The figures below show the magnitude of Dispatchable Emission Free Resource (DEFER) capacity movement from Long Island to upstate zones produced by the set of proposed projects evaluated in the

avoided cost assessment.

T052 - Propel Alt 6	2,158	0	0	-2,158	0

The proposed projects displace between 0.9 – 2.2 GW of DEFR capacity in Zone K and shift that capacity to upstate zones (A-F) to satisfy the NYCA capacity reserve margin. The DEFR capacity is shifted to upstate zones where it is more cost-effective to build generation.

Avoided Capital Cost Results

The two primary factors driving the magnitude of avoided generation capacity are reduced offshore wind energy curtailments and the increased Zone K import transmission limits. Unbottled offshore wind energy reduces the need to build as much solar capacity in upstate zones and, in turn, provides avoided capital cost savings. Increased import transfer limits into Long Island lower the zone's effective capacity margin requirement and enable the movement of DEFR capacity from Zone K to upstate zones where capital costs are lower.

The magnitude of the capital cost savings for each proposed project is generally correlated with the amount of increase in Zone K import capability and reduction in offshore wind energy curtailment. Some secondary factors, such as which zone a project's new lines are connected and the project's increase in Zone K export limit, impact the capital cost savings and could also be used to differentiate the projects.

The figures below show the results of the avoided cost⁴ analysis with disaggregated impacts of

⁴ Generator capital costs align with assumptions for Policy Case Scenario 2 from the *2021-2040 System and Resource Outlook* <https://www.nyiso.com/documents/20142/33395392/2021-2040-Outlook-Appendix-D.pdf>

reduced solar capacity buildout and relocated DEFR capacity for the two scenarios modeled.

Figure 16: Policy Scenario Total Capital Cost Savings

Figure 17: Policy + B-VS Scenario Total Capital Cost Savings

All projects analyzed create capital cost savings through the reduction in upstate solar capacity

additions. The avoided solar capacity represented less than half of the total capital cost savings calculated. Additionally, all projects analyzed in this assessment helped to increase the Long Island transmission security limit and reduced the capacity reserve margin for Long Island (per methodology described above). With a reduced capacity reserve margin in Zone K, DEFR capacity was able to be sited in less costly upstate areas, which constituted over half of the total avoided capital cost savings.

The figure below summarizes the total avoided cost savings for each project analyzed.

Figure 18: Total Capital Cost Savings (\$2022 M)

Project	Total Capital Cost Savings (\$2022 M)	
	Policy Scenario	Policy + B-VS Scenario
T035 - LSPower	2,866	3,240
T036 - NextEra Core 1	3,066	2,586
T040 - NextEra Core 5	3,101	2,731
T048 - Propel Base 2	2,065	2,033
T049 - Propel Base 3	2,141	2,801
T051 - Propel Alt 5	2,873	3,028
T052 - Propel Alt 6	2,909	3,081

In total, the proposed projects evaluated enable between \$2.0-3.2B of avoided capital cost savings through 2040 under this analysis. Projects that enable higher reductions in Long Island offshore wind energy curtailment and increase import capability to Long Island produce the highest savings.
