

Assumptions Matrix for 2023-2042 System & Resource Outlook Draft for Discussion at November 21, 2023 ESPWG

Assumptions for Policy Reference Cases in Capacity Expansion Model

Assumption	"Lower Demand Policy Scenario"	"Higher Demand Policy Scenario"	"State Scenario"	
	Locked Down 11/15/2023			
	n operation in the NYISO system or			
Generator	Awarded generators are defined as those that have been awarded contracts and are incremental to the Base Case.			
Descriptions	Candidate generators are defingeneration expansion increment		nodel assumes as candidates for htracted generators.	
	These generator categories have different characteristics and model assumptions, and so these labels are used to distinguish the characteristics outlined in this assumption's matrix.			
Model Framework				
Study Years	The capacity expansion model is run for years 2023-2042 (inclusive). Results will be reported for model years 2025, 2030, 2035, 2040, and 2042. These are referred to as the "study years" for the purposes of this assessment.			
Time Representation	For each model year, a number of representative days will be identified and selected to represent a year's variety of conditions. These days will be applied and weighted across each model year to represent input renewable generation and load peaks and shapes for that year. These representative days will then be solved individually and chronologically over all the model years of the capacity expansion model. This method preserves chronology, including the state-of-charge (SoC) of battery storage resources, within each representative day.			
	Nodal to zonal reduction of transmission network topology performed by PLEXOS to create a pipe-and-bubble equivalent model, where intra-zonal lines are collapsed. Transmission upgrades beyond the existing system topology included in the model are as follows:			
	 NYPA Northern New York Priority Transmission Project Champlain Hudson Power Express Clean Path New York Joint Utilities Phase 1 & Phase 2 Projects Long Island OSW Public Policy Project 			
Transmission				
			Subzonal constraints modeled to reflect estimated transmission headroom of local transmission & distribution system and conceptual marginal upgrade costs. This information will be incorporated into the model as a headroom constraint with added cost for exceeding the constraint.	

Assumption	"Lower Demand Policy Scenario"	"Higher Demand Policy Scenario"	"State Scenario"	
	Locked	Down 11/15/2023		
	Data Inputs and Forecasting			
Energy Forecast & Peak Load	Hourly load shape for each mod Energy Demand and Peak Loads are based on the 2023 Load & Capacity Data Report (Gold Book) Low Policy Forecast with modifications to account for the following: • Removal of impact from energy storage resources, BTM Solar generation and electrolysis. • Energy storage resources and BTM Solar are modeled explicitly as resources. • Large loads are included in the load forecast.	 del year. Load shape based on Energy Demand and Peak Loads are based on the 2023 Load & Capacity Data Report (Gold Book) High Policy Forecast with modifications to account for the following: Removal of impact from energy storage resources, BTM Solar generation and electrolysis. Energy storage resources and BTM Solar are modeled explicitly as resources. Large loads are included in the load forecast. 	 2018 weather year. Energy Demand and Peak Loads are based on the "Scenario 2" forecast from the CAC Integration Analysis with modifications to account for the following: Removal of impact of flexible loads and electrolysis. Energy storage resources and BTM Solar are modeled explicitly 50% of economy-wide hydrogen needs in model are met by in- state electrolysis on an annual basis. Loads have been adjusted upward to account for transmission and distribution losses Large loads are included in the 	
Emissions Price Forecast	Emissions allowance price forecast is the same as that assumed in the production cost model. See Assumptions in Production Cost Model for Reference Cases for additional detail.			
	Fuel price forecast is the same as that assumed in the production cost model. See Assumption in Production Cost Model for Reference Cases for additional detail.			
Fuel Price Forecast	Fuel price forecast for Dispatchable Emission-Free Resources is specified in the Variable O&M portion of this document.		Fuel price forecast for new and retrofit Hydrogen combustion turbine technologies are specified in the Variable O&M portion of this document.	
Constraints				
Capacity Reserve Margin	Capacity reserve margins (IRM and LCRs) for the 2023-2024 Capability Year are translated to the UCAP equivalent and applied to all model years, per <u>NYISO ICAP to UCAP</u> <u>translation</u> .		Capacity Reserve Margin taken from Integration Analysis modeling, which shows a dynamic reserve margin out to 2050.	
	Model years 2030 and beyond will assume adjustments to LCR requirements to address major topology and system changes per <u>TSL floor methodology</u> .		Model years 2030 and beyond will assume adjustments to LCR requirements to address major topology and system changes per <u>TSL floor methodology</u> .	

Assumption	"Lower Demand Policy Scenario"	"Higher Demand Policy Scenario"	"State Scenario"	
Locked Down 11/15/2023				
	CLCPA targets and other state policy mandates modeled include: • 6 GW BTM-PV by 2025 • 10 GW BTM-PV by 2030 • 9 GW offshore wind by 2035			
Policy Targets	 70% renewable energy by 203 3 GW energy storage by 2030 Zero carbon electricity by 204)	 70% renewable energy by 2030; Consistent with Integration Analysis, CHPE is incremental to 70x30 while generation associated with CPNY will count towards 70x30 6 GW energy storage by 2030 Zero carbon electricity by 2040; net zero imports overall from IESO, PJM and ISONE. 	
Maximum Resource Potential	Candidate generator locations and availability determined by <u>supply curve analysis</u> undertaken by NYSERDA and consultants. Resource potential is comprised of GIS analysis to review siting and land availability, generation potential, and total MW potential per site, county, and/or zone by year.			
	Generators	and Generator Properties		
Generators assumed in the capacity expansion model are the same as those included in Base & Contract Case production cost model (i.e., base and awarded generators). General specific information is assumed for these generators. See Assumptions in Production Cost for Reference Cases for additional detail.				
	The types of generators and initial start year for expansion (" candidate generators") include the following:			
	 Land-based wind: 2028 Utility PV: 2028 Offshore wind: 2031 Battery storage, 4- and 8-hour: 2025 			
Generators	Dispatchable Emission-Free R	Resource (DEFR): 2031	New Hydrogen combustion turbine and combined cycle technology: 2031	
	Generation expansion will be en generator type for candidate ge technology type.		Retrofit Hydrogen combustion turbine and combined cycle technology: 2035	
			Generation expansion will be enabled at the county level by generator type for candidate generators, as applicable to technology type.	

Assumption	"Lower Demand Policy Scenario"	"Higher Demand Policy Scenario"	"State Scenario"	
	Locked	Down 11/15/2023		
	Known generator retirements for base generators are the same as those included in the Base & Contract Case production cost model.			
	Firm retirements for NYPA small gas plants in model year 2031.			
Generator	The capacity expansion model simulates optimal retirement decisions, which would include incremental generator retirements beyond those with a prescribed retirement date.			
Retirements			Age-based fossil retirements for existing units are assumed with phase-in of age-based retirements for fleet of generators past age-based threshold (60 years) still in operation.	
	Heat rates for base generators are the same as the production cost model. Generator specific information is assumed for these generators. See <i>Assumptions in Production Cost Model for Reference Cases</i> for additional detail. Heat rates for awarded & candidate generators are applied on a technology type basis from Table 3 of the EIA Annual Energy Outlook 2023, Assumptions to Electricity Market Module.			
Generator Heat Rate	Heat rates for candidate DEFRs Candidate Generator Low Capital High Operating (LcHo) Medium Capital Medium Operating	are as follows: Heat Rate (Btu/kWh) 9,124	Heat rates for candidate Hydrogen repowered units align with the <u>Scoping Plan: Integration</u> <u>Analysis Annex 1 ("Thermal Op</u> <u>Char")</u> .	
	High Capital Low Operating (HcLo)	10,447	Candidate Generator Heat Rate (Btu/kWh) New hydrogen CT 10,100 New hydrogen CC 6,500	
			*Heat rate above represents the maximum power output per Integration Analysis.	
	Fuel cost for candidate DEFRs a	re as follows: Fuel Cost (\$/MMBtu)	Fuel cost for candidate hydrogen repowered units are as follows:	
Generator Fuel Cost	Low Capital Higher Operating (LcHo) Medium Capital Medium Operating (McMo) High Capital Low Operating (HcLo)	40 22.50 2.5	Candidate GeneratorFuel Cost (2020 \$/MMBtu)New and retrofit hydrogen CT/CC30.11	
			*Fuel cost above represents the cost in model year 2030; costs are projected to vary over time per Integration Analysis.	
	Capital cost is only applied to ca	Indidate generators.		

Assumption	"Lower Demand Policy Scenario"	"Higher Demand Policy Scenario"	"State Scenario"		
	Locked Down 11/15/2023				
	The capital costs are assumed by technology type per Table 3 of the <u>EIA Annual Energy Outlook 2023</u> , <u>Assumptions to</u> <u>Electricity Market Module</u> for land-based wind, Utility PV, offshore wind, and battery storage resources to be adjusted on a zonal basis based on the NYSERDA Supply Curve Analysis.		The capital costs are assumed by technology type per NYSERDA Supply Curve Analysis for land- based wind, Utility PV and offshore wind to be adjusted on a zonal basis.		
Generator Costs: Capital Cost	The capital costs assumed for c follows, and will be adjusted on <u>Candidate Generator</u> Low Capital High Operating (LcHo) Medium Capital Medium Operating High Capital Low Operating (HcLo)	a zonal basis: Capital Cost (\$/kW) 2,000	The capital costs assumed for candidate Hydrogen repowered units align with the Scoping Plan: Integration Analysis Annex 1 ("Resource Costs – Mid"), and will be adjusted on a zonal basis.Candidate GeneratorCapital Cost (2020 \$/kW)New hydrogen CT1,195 New hydrogen CCNew hydrogen CC1,673		
	The Fixed O&M (FO&M) costs for Documentation, Chapter 4: Gen		*Capital cost above represents the cost in model year 2031; costs are projected to vary over time per Integration Analysis. d by data from the <u>EPA Platform v6</u>		
	The FO&M costs for awarded & candidate generators are provided by estimates in Table 3 of the <u>ElA Annual Energy</u> <u>Outlook 2023, Assumptions to Electricity Market Module</u> , to be adjusted on a zonal basis based on the NYSERDA Supply Curve Analysis.		The FO&M costs for awarded & candidate generators are assumed per NYSERDA Supply Curve Analysis to be adjusted on a zonal basis.		
Generator Costs: Fixed O&M Cost	The FO&M costs for candidate DEFRs are as follows:Candidate GeneratorFixed 0&M (\$/kW-yr)Low Capital High Operating (LcHo)28Medium Capital Medium Operating (McMo)75High Capital Low Operating (HcLo)122		The FO&M costs for candidate Hydrogen repowered units align with the <u>Scoping Plan: Integration</u> <u>Analysis Annex 1 ("Resource</u> <u>Costs – Mid"</u>).		
			Candidate GeneratorFixed 0&M (2020 \$/kW- yr)New hydrogen CT16.3New hydrogen CC24.2Retrofit hydrogen CT28.6Retrofit hydrogen CC43.2		

Assumption	"Lower Demand Policy Scenario"	"Higher Demand Policy Scenario"	"State Scenario"

Generator UCAP Ratings and Marginal ELCC Curves	For renewable resources (e.g., la offshore wind) and battery storag Firm Capacity contribution is bas curves. The marginal ELCC curve applicable technology type in the The marginal ELCC Curves for re calculated based on the new res during top 1% (P99) of peak net contribution during top net load curves for battery storage resoun the new resource's peak deman peak net load hour. Variables co ELCC curve calculation specific t include hourly load, resource con peak demand reduction for rene resources respectively), and hou evaluated. Marginal ELCC curves are calcul each applicable technology type Locality for summer and winter s For all other base generators, Fin historic values, consistent with t	For renewable resources (e.g., land-based wind, Utility PV, offshore wind) and battery storage resources, a resource's Firm Capacity contribution is based on marginal (incremental) ELCC curves. ELCC curves are calculated for each applicable technology type in the NYCA and for each Locality. The specific curves will be leveraged from the Integration Analysis (pg. 119- 125).	
External Area Properties			

Assumption	"Lower Demand Policy Scenario"	"Higher Demand Policy Scenario"	"State Scenario"		
	Locked Down 11/15/2023				
External Areas: Energy Forecast	Neighboring regions peak and energy forecast updated utilizing load forecast data from PJM, ISO- NE, and IESO to represent "policy futures" based on publicly available reports.				
External Areas: Generators	Generation fleet evolution for neighboring regions updated for PJM, ISO-NE, and IESO to represent "policy futures" based on publicly available reports. Generation expansion will not be enabled in the capacity expansion model for neighboring regions.				
External Areas: Fuel Forecast	Fuel price forecast is the same as that assumed in the production cost model for External World Model. See Assumptions in Production Cost Model for Reference Cases for additional detail.				
External Areas: Emissions Price Forecast	Emissions price forecast is the same as that assumed in the production cost model for External World Model. See Assumptions in Production Cost Model for Reference Cases for additional detail.				
External Areas: System Representation	HQ imports modeled with a fixed hourly schedule. Historic level of imports will be assumed and adjusted accordingly to account for firm <u>contracts</u> (e.g., CHPE and NECEC). Transmission network for PJM, ISO-NE, and IESO regions included in pipe-and-bubble equivalent model to link external regions to NYCA system.
