

Review of 2024 Regional Load Growth Factors

Max Schuler Demand Forecasting & Analysis

Load Forecasting Task Force

December 5, 2023

Agenda

Regional Load Growth Factor (RLGF) Evaluation Criteria

2023 Economic Data

Evaluation of 2024 RLGFs

RLGF Evaluation Criteria

Evaluation of RLGFs – Criteria 1, 2, and 3

- Regional Load Growth Factors are submitted to the NYISO by the Transmission Owners, and reflect expected growth in summer peak load. The 1+RLGF is expressed as the ratio of the forecast year peak load to the current year weather normalized peak.
- The Load Forecasting Manual specifies that the NYISO will evaluate Regional Load Growth Factors (RLGFs) in the current year for each Transmission District based upon three criteria:
 - Criterion 1 Index of Recent Historical Peak Load Growth
 Bandwidth based only on the recent growth of weather-adjusted peaks
 - Criterion 2 Projection of Peak Load Growth in Relation to Economic Growth
 Projection of peak load growth based on a regression of historical summer daily peaks, historical economic data
 and other variables, and projected economic growth
 - Criterion 3 Projections Performed by the ISO

An independent projection of load growth currently based upon a regression of historical summer energy, historical economic data and other variables, and projected economic growth

 If at least two of the three criteria are satisfied, then the load growth factor for the Transmission District is accepted.

Criterion 1 – Index of Recent Historical Peak Load Growth

- Calculate annual growth in weather normalized peaks over the past five years, using Transmission Owner's weather normalized peaks
- Select the 2nd highest annual growth rate of weather-normalized peaks as the upper bound on growth and the 2nd lowest annual growth rate of weather normalized peaks as the lower bound on growth, with a minimum of a 1% difference between the two

Criterion 2 – Projection of Peak Load Growth in Relation to Economic Growth

- Uses daily weather, peak and economic data from the most recent 5 to 15 summers
- Regression model based on top ten Transmission District peak load days from each summer
- Regress daily peak MW against daily weather, annual macroeconomic variable(s), energy
 efficiency and BTM solar growth variable if significant, and other variables as appropriate
 to determine next year's predicted peak load using the projected economic growth
- Calculate a 25th to 75th percentile confidence interval for the predicted peak load based on the standard error of the regression to obtain the upper and lower bounds for the RLGF, with a minimum of a 1% difference between the two. The NYISO may take into account additional factors when establishing the range for Criterion 2

Criterion 3 – Projections Performed by the ISO: Summer Energy Growth

- Regress historical summer energy (July and August GWh) against summer CTHI (Cumulative Temperature & Humidity Index), macroeconomic variable(s) if significant, energy efficiency and BTM solar growth variable, and other variables as appropriate to determine the predicted summer energy for the following year
- Calculate a 25th to 75th percentile confidence interval for the predicted summer energy based on the standard error of the regression to obtain the upper and lower bounds for the RLGF, with a minimum of a 1% difference between the two. The NYISO may take into account additional factors when establishing the range for Criterion 3
- The Criterion 3 methodology is developed by the ISO, and is an independent measure separate from Criteria 1 and 2. The NYISO may change the Criterion 3 methodology as necessary

Combined Criterion (Criteria 1 and 2)

- In the event that the ranges for Criterion 1 and Criterion 2 are mutually exclusive, the NYISO will construct an alternate Criterion by combining the ranges of Criterion 1 and Criterion 2
- The upper and lower bounds of the combined Criterion shall typically be calculated by averaging the upper bounds of Criterion 1 and Criterion 2, and averaging the lower bounds of Criterion 1 and Criterion 2, with a minimum 1% difference between the upper and lower bounds
- In the event that Criterion 1 and Criterion 2 are combined, then it is sufficient for the RLGF to satisfy either the Combined Criterion or Criterion 3

Historical and Forecast Economic Data

Evaluation of 2024 RLGFs

2024 Criteria 1, 2 & 3 RLGF Evaluation Summary

Load Growth Criteria

A '1' in the column labeled 'Test' indicates that the RLGF is between the upper and lower bandwidths.

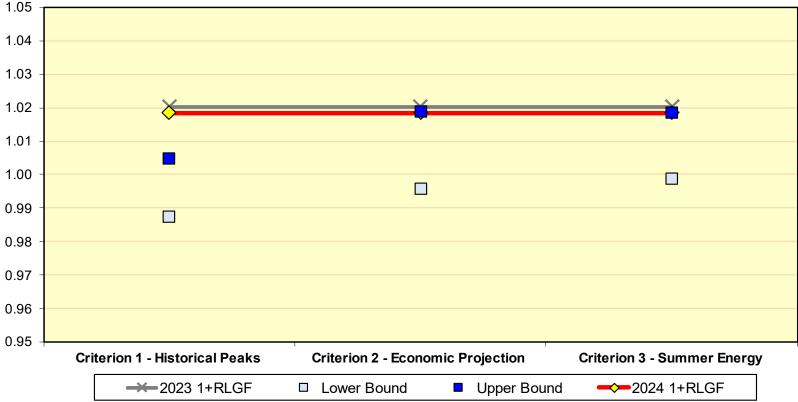

A '0' in the column labeled 'Test' indicates that the RLGF is not between the upper and lower bandwidths.

Each RLGF must fall within 2 of the 3 criteria. In the event that Criteria 1 and 2 are mutually exclusive and a Combined Criterion is required, it is sufficient for the RLGF to fall within either the Combined Criterion or Criterion 3.

| т.о. | Criterion | Lower Bound | 2024 1+RLGF | Upper Bound | Test | 2023 1+RLGF |

Con Edison 1+RLGF Criteria

The Con Edison 1+RLGF of 1.0185 passes Criteria 2 and 3, and is accepted.

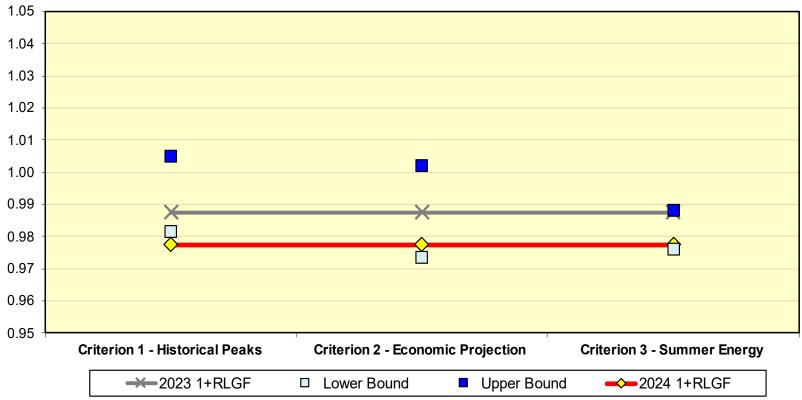

Central Hudson 1+RLGF Criteria

The Central Hudson 1+RLGF of 0.9869 passes all three Criteria and is accepted.

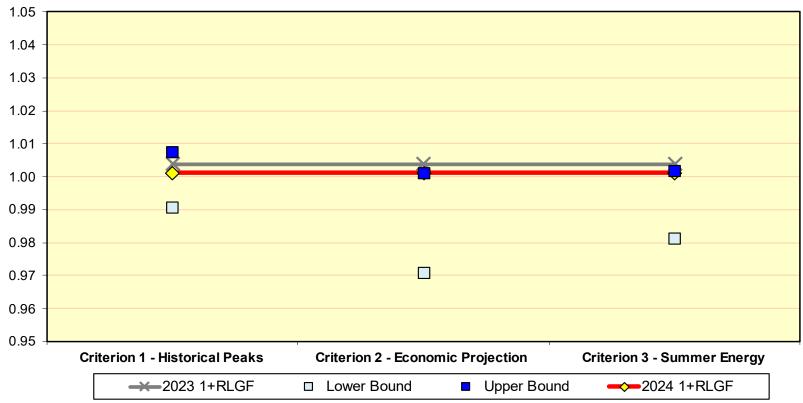

LIPA 1+RLGF Criteria

The LIPA 1+RLGF of 0.9775 passes Criteria 2 and 3, and is accepted.

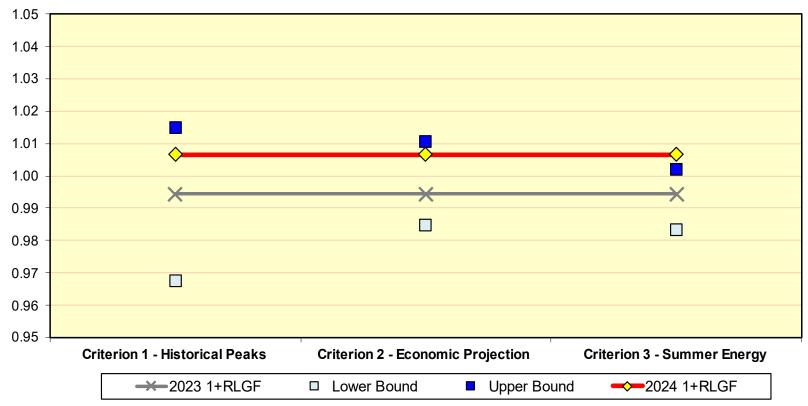

National Grid 1+RLGF Criteria

The National Grid 1+RLGF of 1.0012 passes Criteria 1 and 3, and is accepted.

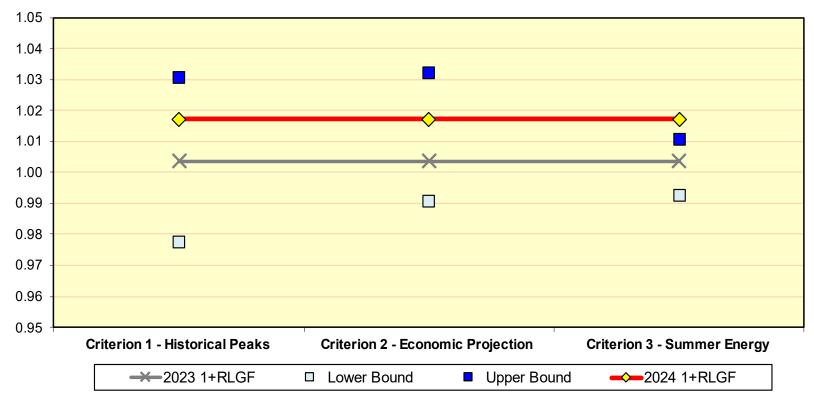

NYSEG 1+RLGF Criteria

The NYSEG 1+RLGF of 1.0065 passes Criteria 1 and 2, and is accepted.

Orange & Rockland 1+RLGF Criteria

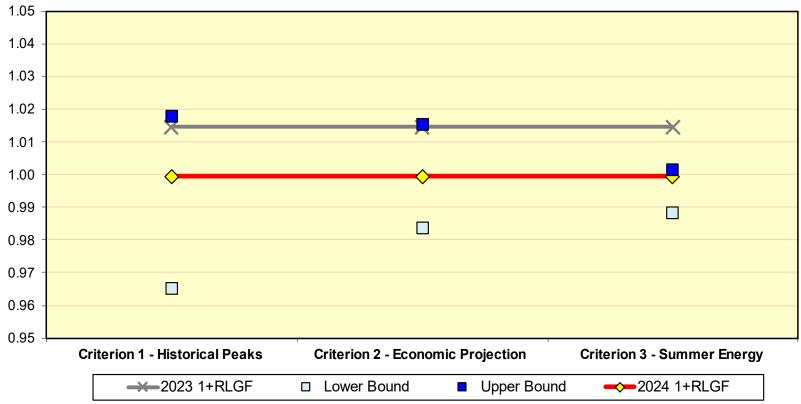

The Orange & Rockland 1+RLGF of 1.0172 passes Criteria 1 and 2, and is accepted.
